Managing Motion for MRI

M229 Advanced Topics in MRI 2020.05.07

Holden H. Wu, Ph.D.

Magnetic Resonance Research Labs Department of Radiological Sciences, University of California, Los Angeles, CA, USA

Class Business

- Homework 2 due 5/8 Fri
- Project proposal due 5/11 Mon
- Office hours on Fri
- Guest lecture on 5/12 Tue
 - Dr. Le Zhang: MR Temperature Mapping

• Finish ORC from last lecture

Outline

- MRI and Motion
- Techniques to Manage Motion
- Managing Cardiac Motion
- Managing Respiratory Motion

- MRI is slow (vs. US, X-ray, CT)
- MRI time scales
 - **-** TR: 1 1000 ms
 - image: 100 ms 10 min

- Motion Characteristics
 - voluntary vs. non-voluntary
 - periodic vs. aperiodic
 - rigid vs. non-rigid
 - e.g., translation, rotation, shearing ...
 - inter-voxel vs. intra-voxel
 - inter-view vs. intra-view

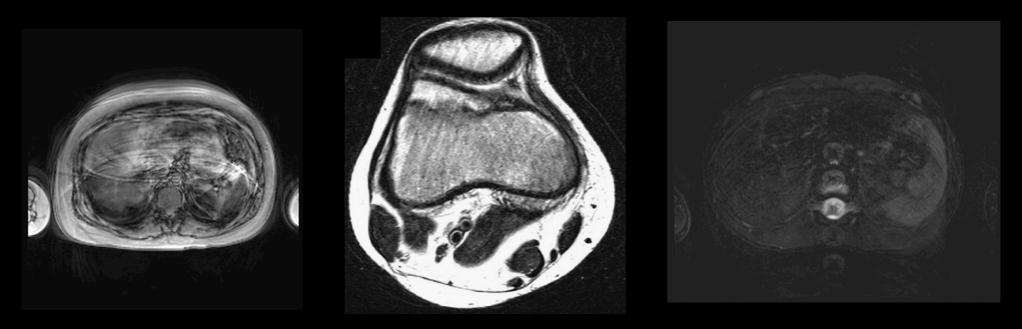

- Motion Sources, Time Scales, Magnitudes
 - cardiac: ~60 bpm (1 Hz), mm
 - respiratory: ~5 sec/breath (0.2 Hz), mm cm
 - bulk motion: mm cm
 - vascular pulsation, CSF pulsation: mm
 - peristalsis: mm
 - swallowing, coughing, twitching: mm cm
 - blood flow

- Effects of Motion on MRI Quality
 - inter-view vs intra-view motion frequency encoding vs. phase encoding
 - k-space inconsistency
 - image blurring; aliasing artifacts; signal dropout; other artifacts

Techniques to Manage Motion

- Subject Setup and Communication
- Acquisition Methods
- Reconstruction Methods

Subject Setup and Communication

- Explain Scan Procedures
- Medication (if required)
 - reduce claustrophobia
 - reduce peristalsis
- Coaching (e.g., stay still, breath hold)
- Coil and placement
- ECG and bellows placement
- Reassurance and breaks

Acquisition Methods

- Suppress Signal from Moving Tissues
 - e.g., flow suppression, spatial saturation
- Swap Frequency and Phase Encoding Directions
 - e.g., A/P vs R/L in axial acquisitions
- Multiple Averages
- Disadvantages?

courtesy of Dr. Kyung Sung

Acquisition Methods

- Accelerate the Acquisition
 - partial Fourier
 - parallel imaging
 - multi-slice imaging
 - single-shot EPI
 - single-shot HASTE
- Use Motion-Robust Acquisition
 - gradient moment nulling
 - PROPELLER / BLADE, radial, spiral, etc.
- Disadvantages?

Reconstruction Methods

- Reconstruct Undersampled Data
 - partial Fourier
 - parallel imaging
- Motion Compensation
 - may need some motion information
 - reject inconsistent data
 - use consistent data
 - correct motion-affected data

• Disadvantages?

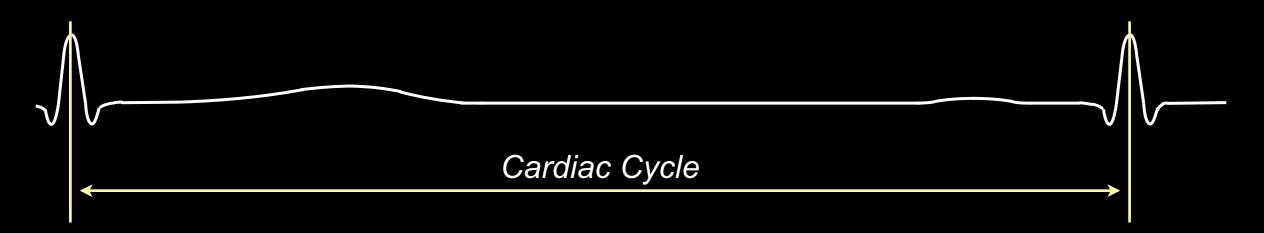

- Cardiac Motion
 - non-voluntary
 - non-rigid
 - quasi-periodic
 - ~60 bpm (1 Hz)
 - mm scale

Cardiac Phases

Phase 1	Phase 2	Phase 3
---------	---------	---------

Temporal duration of the cardiac phases?

- <50 ms to resolve cardiac motion (i.e., >20 frames/sec)
- depends on sampling parameters (and trade-offs)

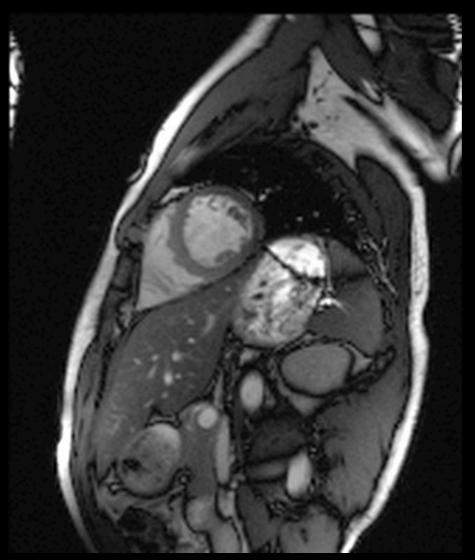

Real-Time MRI

Real-Time MRI

courtesy of Dr. Daniel Ennis

- Real-Time MRI: Challenges
 - compromises in spatial resolution and/or temporal resolution (i.e., frame rate)
 - typical parameters
 - 2-3 mm in-plane resolution 50-200 ms/frame (5-20 frame/sec)
 - may not have high enough spatial resolution and/or frame rate to resolve cardiac motion

- Cardiac Triggering
 - ECG or pulse ox signal
 - sync scan to cardiac cycle
 - assume steady HR
 - segmented acquisition

 acquire subset of data each HB
 fully acquire data over multiple HBs
 - Need to manage respiratory motion as well e.g., breath holding (BH)

Cardiac Triggering

ECG lead placement

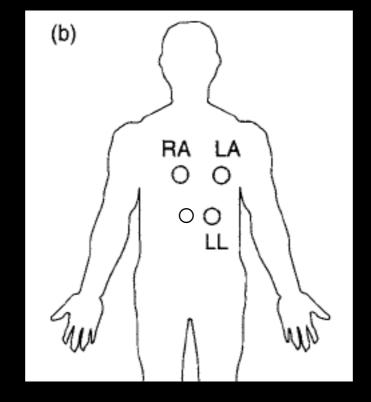

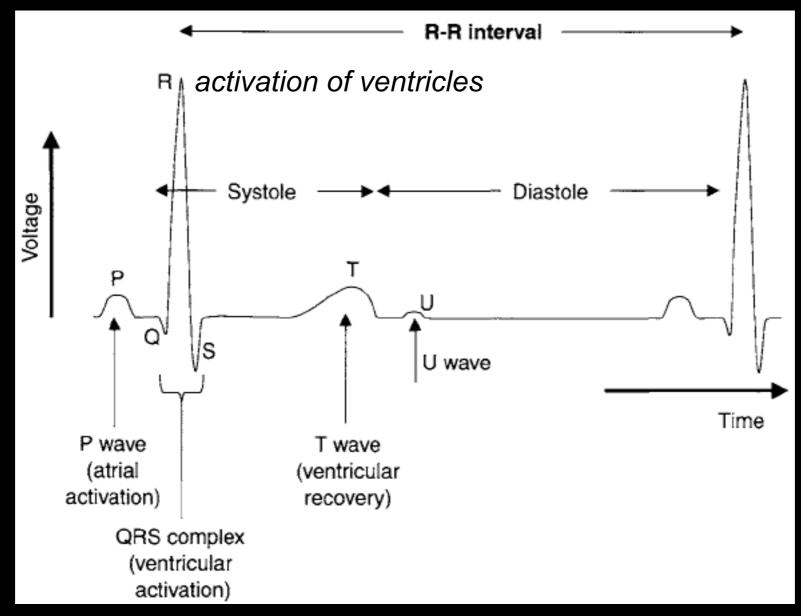

Fig. 12.3, Handbook of MRI Pulse Sequences

Cardiac Triggering

R-R interval [ms] = 60,000 / heart rate [bpm]

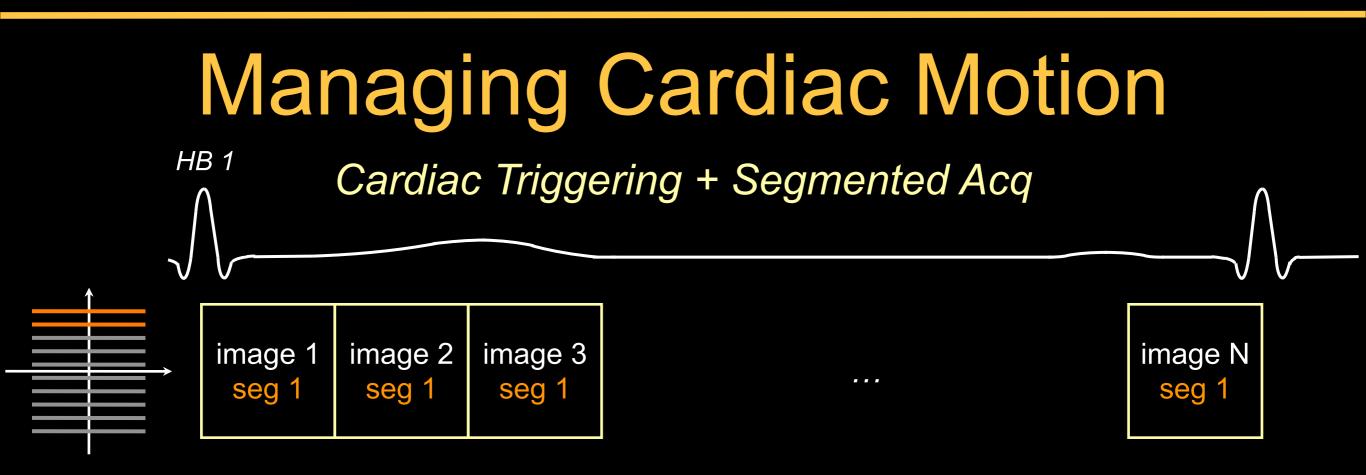

Fig. 12.2, Handbook of MRI Pulse Sequences

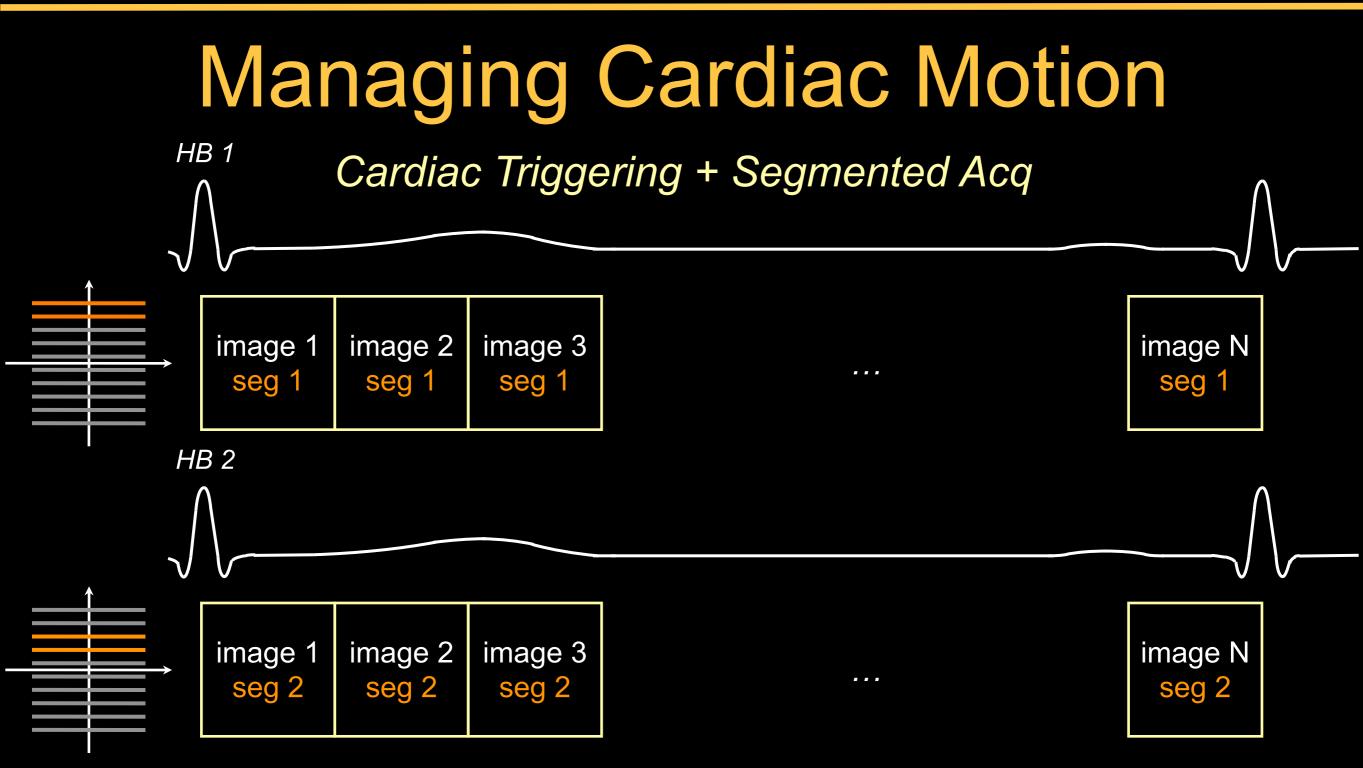

How many lines per segment?

- LinesPerSeg * TR = temporal duration of "cardiac phase"

How many heartbeats (HB) needed?

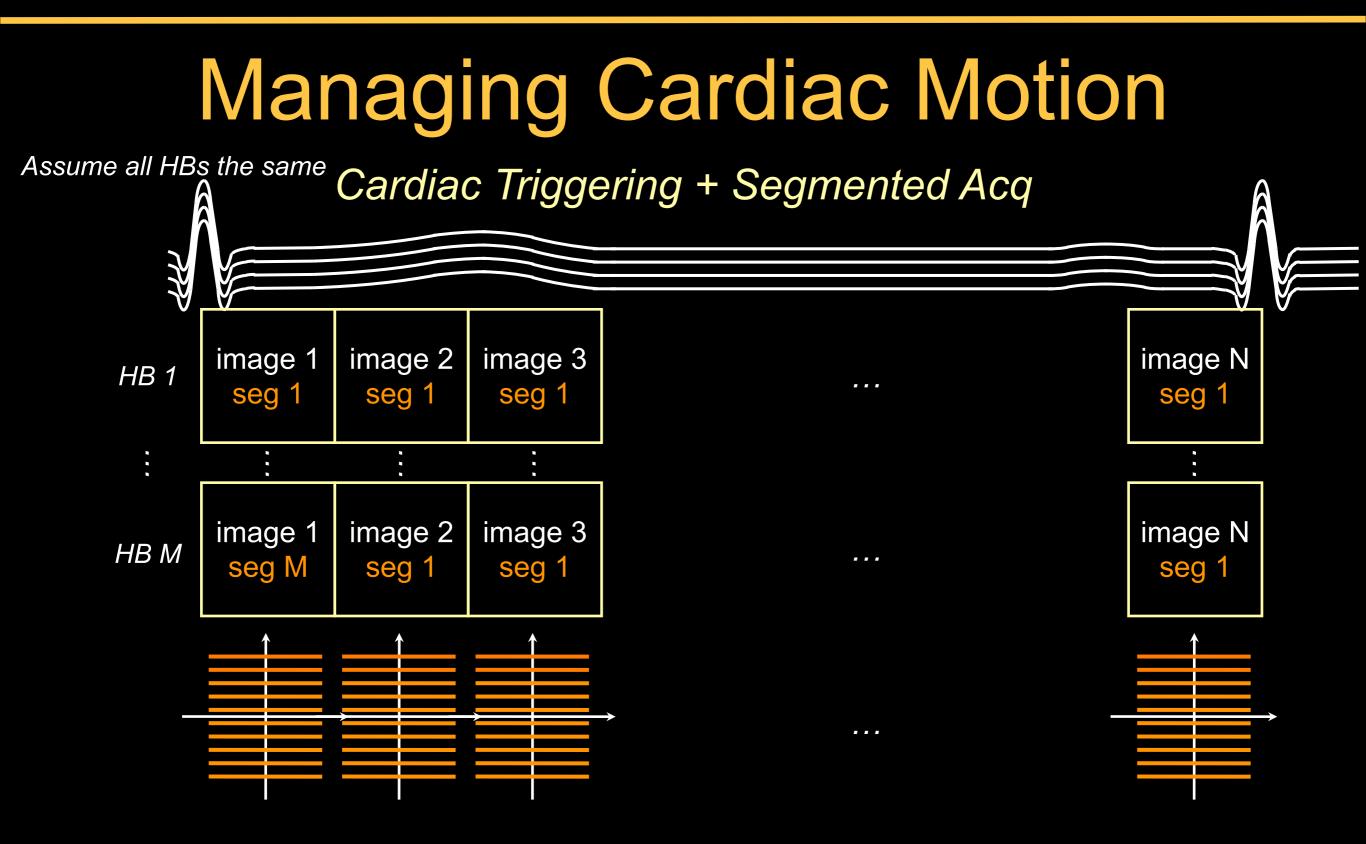

- need M = NumKspLines / LinesPerSeg segments to cover k-space

Radiology

UCLA

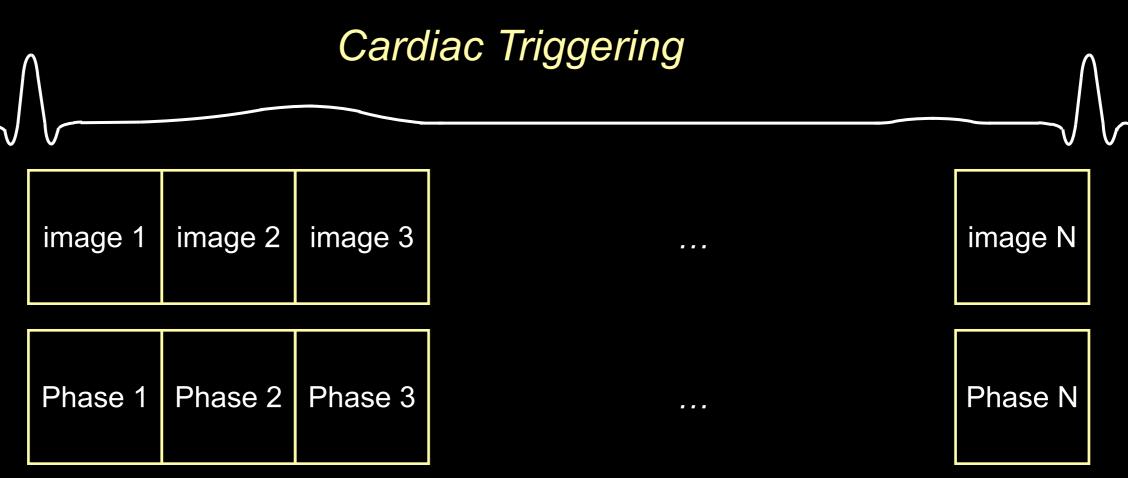

- If we need M segments to cover k-space, need M heartbeats

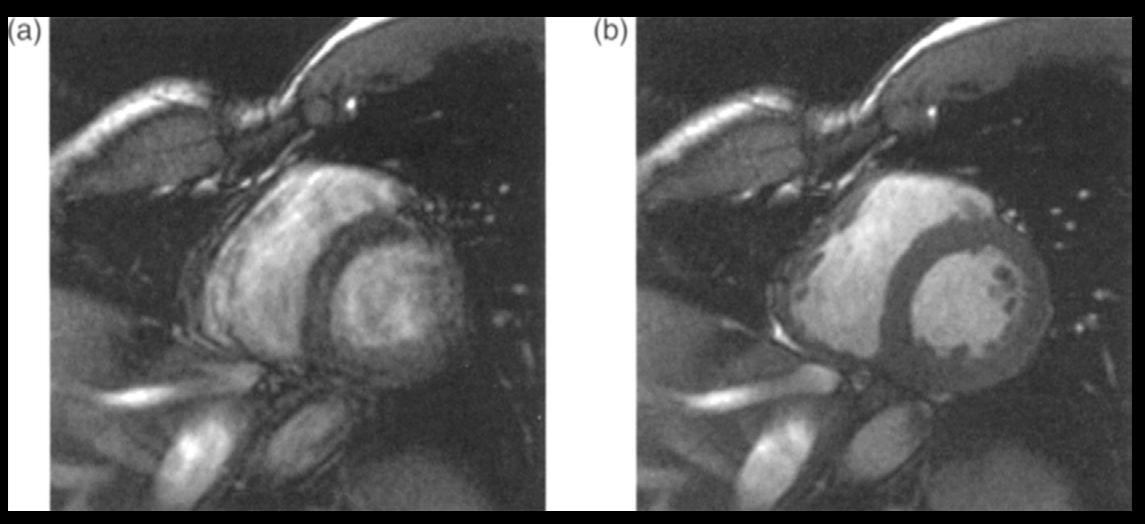

Example

- NumKspLines = 128
- LinesPerSeg = 8; TR = 5 ms
- temporal duration of "cardiac phase" = 40 ms (i.e., 25 phases per sec)
- need M = 128/8 = 16 segments
- need a 16-HB breath hold scan

Cardiac Triggering

No triggering

ECG triggering

Fig. 12.1, Handbook of MRI Pulse Sequences

Cardiac Triggering

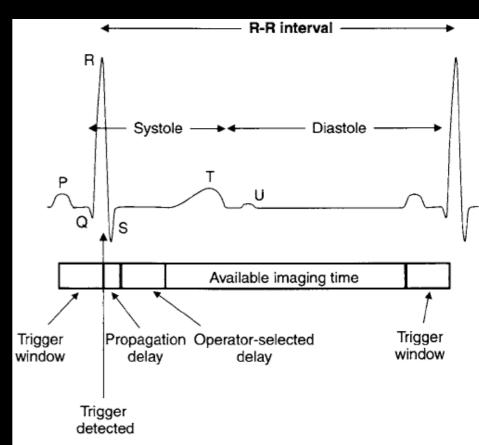

courtesy of Dr. Daniel Ennis

Prospective triggering

Retrospective triggering

• Advantages and Disadvantages?

Fig. 12.4, Handbook of MRI Pulse Sequences

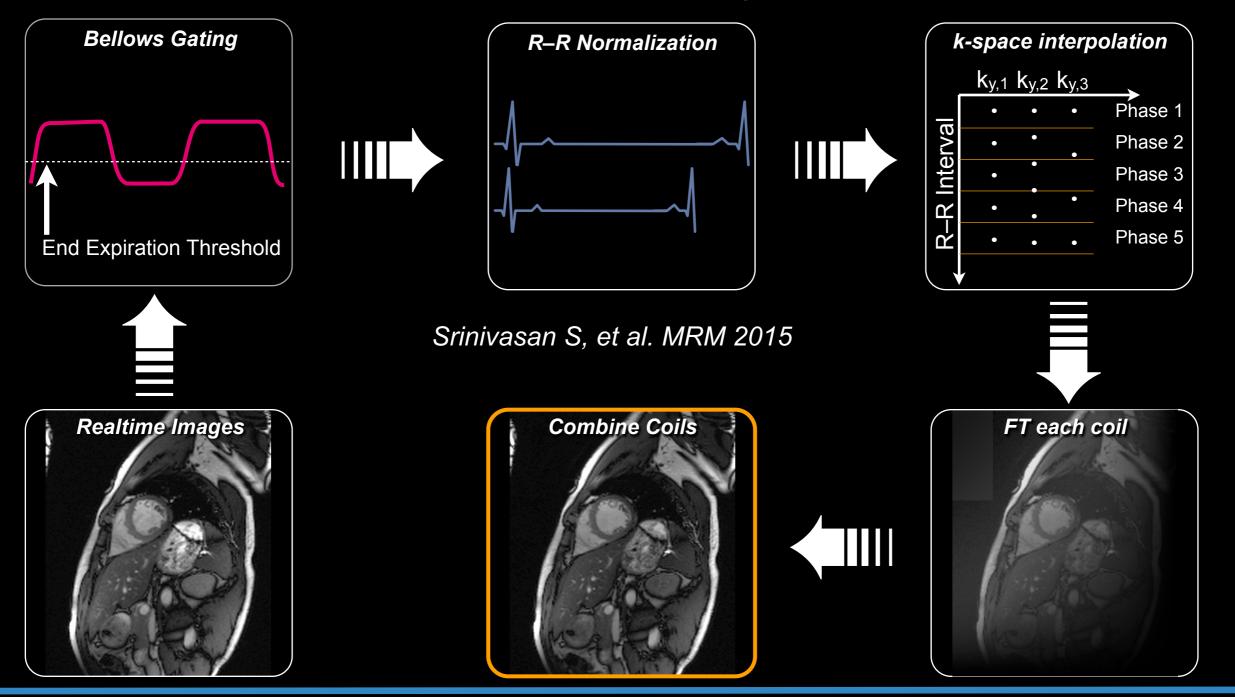

- Cardiac Triggering: Challenges
 - unreliable ECG signal especially at higher field (B₀≥3T)
 - variations in each HB
 - fast HR; irregular HR
 - BH limits scan duration limits # HBs limits segmentation and # cardiac phases

- Respiratory Motion
 - voluntary
 - non-rigid
 mostly S/I
 - quasi-periodic
 - ~5 sec/breath (0.2 Hz)
 - mm cm scale

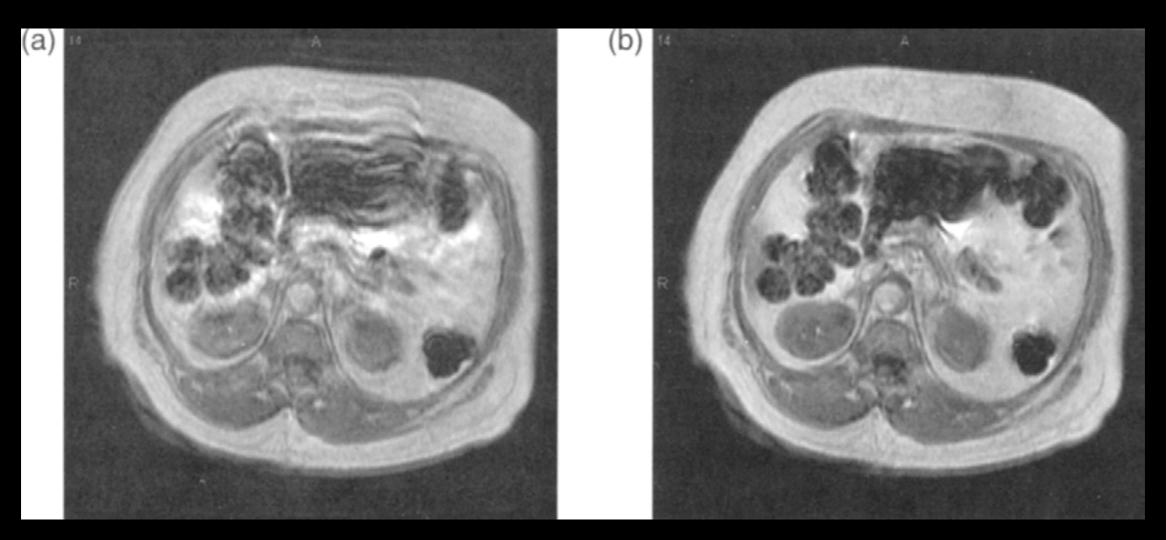

- Breath Holding (BH)
 - temporarily suspend respiratory motion
 - usually end expiration or end inspiration
 - 10-20 sec in patients
 - may need multiple BH (sets of slices/slabs)

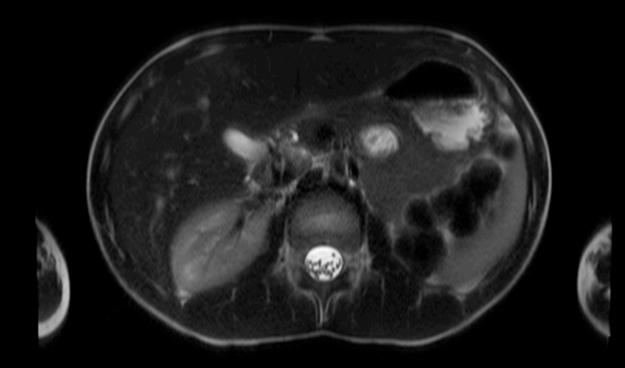

No breath-holding

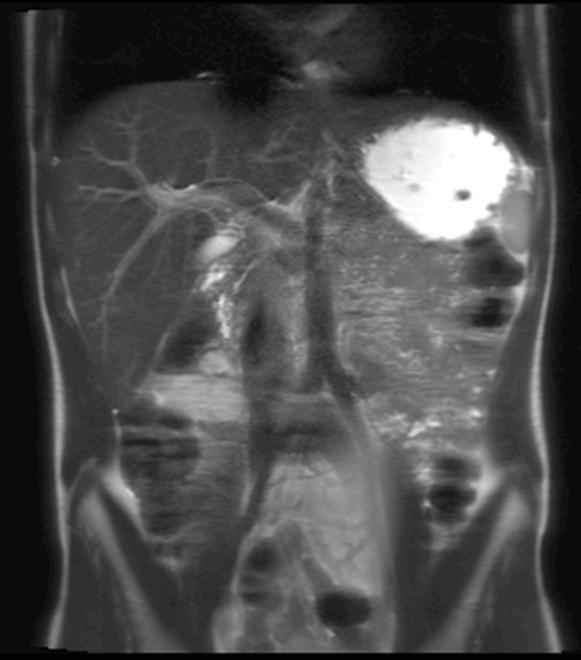

With breath-holding

Fig. 12.15, Handbook of MRI Pulse Sequences

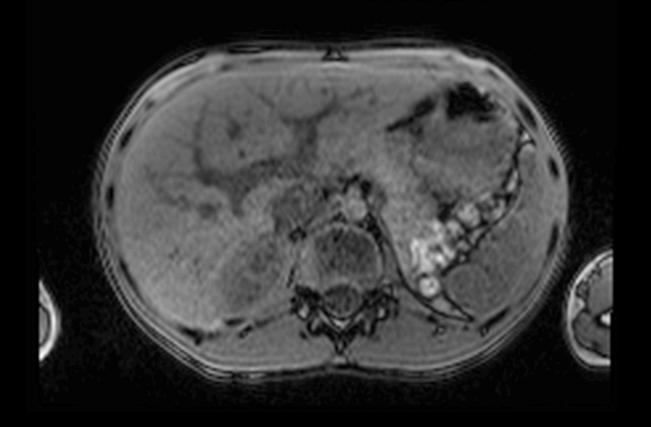

BH T2w HASTE AXL (2D)

BH T2w HASTE COR (2D)

BH T1w VIBE AXL (3D)

BH T1w VIBE COR (3D)

- BH MRI: Challenges
 - short BH duration compromises in scan parameters
 - imperfect BH
 - residual motion artifacts (e.g., aliasing)
 - multiple BH scans wears subject down inconsistent BH position
 - patient may be unable to BH

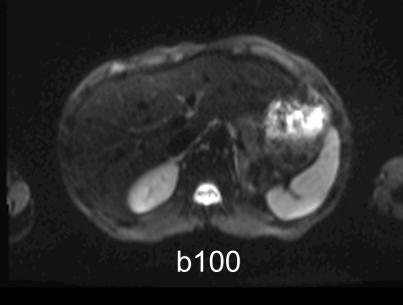

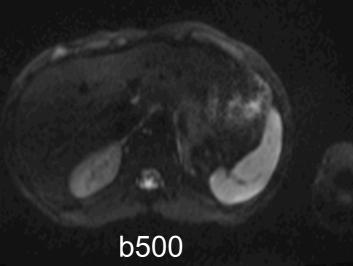

- Free Breathing (FB) + Multiple Averages
 - average out the motion
 - e.g., 3-8 averages
 - can be used for different types of motion

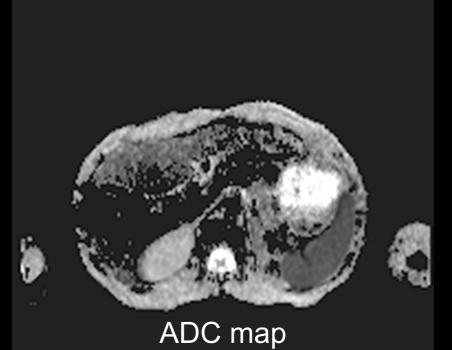

FB EP-DWI AXL (2D)

b1000

- FB + Multiple Averages: Challenges
 - variations in respiratory pattern
 - image blurring
 - residual artifacts (e.g., aliasing)
 - long scan

- FB + Respiratory Gating
 - measure respiratory status / position e.g., bellows, MR navigator signal
 - acquire data when in consistent resp. state
 - fully acquire data over multiple resp. cycles

- MR Navigators
 - MR data to track motion
 - Assumes negligible motion between navigator and imaging data
 - Use navigator info to prospectively or retrospectively compensate for motion

MRI with Navigators

Nav	Imaging	Nav	Imaging	Nav	Imaging	
-----	---------	-----	---------	-----	---------	--

MR Navigator: 1D Example

Respiratory Gating

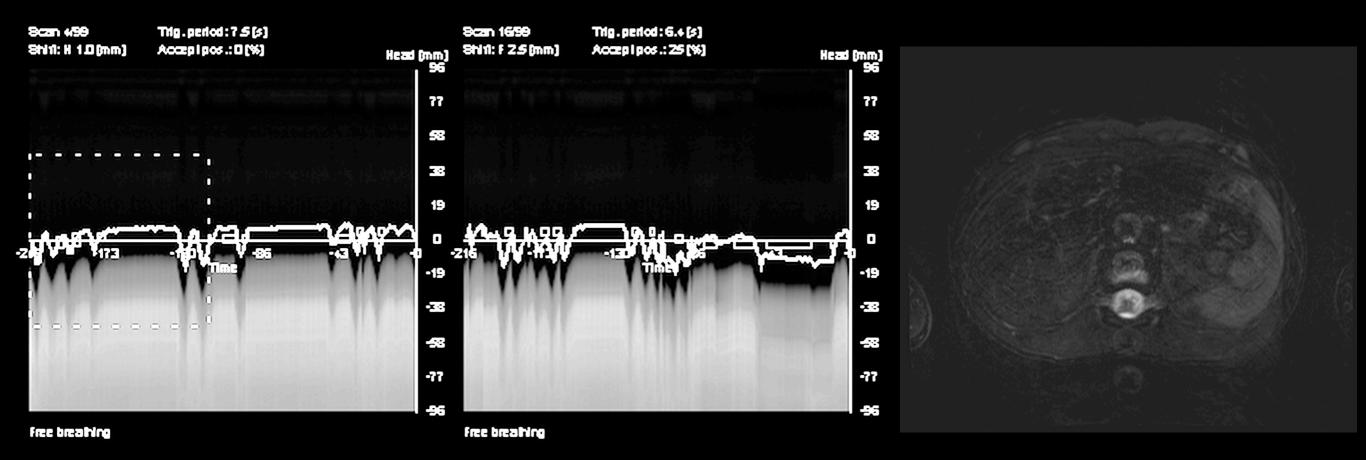

Prospective vs. Retrospective

courtesy of Dr. Fei Han

Respiratory Gating

FB T2w TSE AXL (2D)

- FB + Respiratory Gating: Challenges
 - inconsistent respiratory pattern
 - residual motion artifacts (e.g., aliasing)
 - can be long scans with unknown duration

- FB + Retrospective Compensation
 - measure respiratory status / position e.g., bellows, MR navigator signal
 - determine the most consistent respiratory position (can also bin data into motion states)

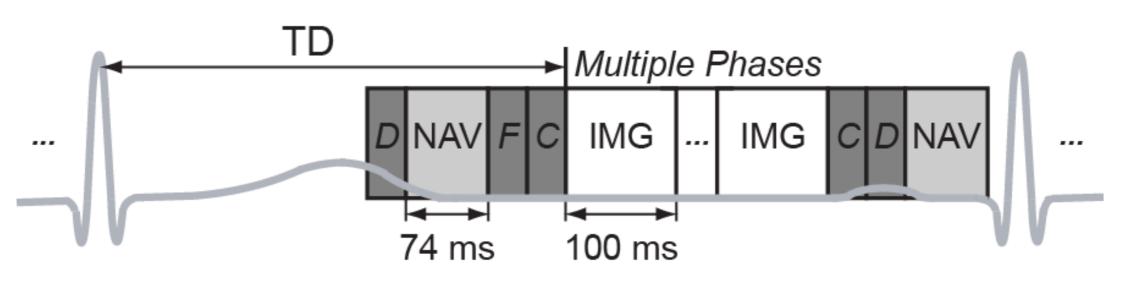

Radiology

UCLA

- reject or compensate data outside of consistent respiratory position
- reconstruct data (may be undersampled)

FB + Cardiac Triggering + Navigators

Motion-Resolved Reconstruction

fully sampled (motion averaged) Soft-gated Expiration

Soft-gated Inspiration

courtesy of Shu-Fu Shih

- FB + Retrospective Compensation
 - Non-Cartesian acquisition
 - Self-navigation signal
 - determine the most consistent respiratory position (can also bin data into motion states)
 - reject or compensate data outside of consistent respiratory position
 - reconstruct data (may be undersampled) using prior information and constraints

Summary

- MRI and Motion
- Techniques to Manage Motion
- Managing Cardiac Motion
- Managing Respiratory Motion
