# The Fourier Transform and its Applications

The Fourier Transform:

$$F(s) = \int_{-\infty}^{\infty} f(x)e^{-i2\pi sx}dx$$

The Inverse Fourier Transform:

$$f(x) = \int_{-\infty}^{\infty} F(s)e^{i2\pi sx}ds$$

# Symmetry Properties:

If g(x) is real valued, then G(s) is Hermitian:

$$G(-s) = G^*(s)$$

If g(x) is imaginary valued, then G(s) is Anti-Hermitian:

$$G(-s) = -G^*(s)$$

In general:

$$g(x) = e(x) + o(x) = e_R(x) + ie_I(x) + o_R(x) + io_I(x)$$
  
 $G(s) = E(s) + O(s) = E_R(s) + iE_I(s) + iO_I(s) + O_R(s)$ 

#### Convolution:

$$(g*h)(x) \stackrel{\triangle}{=} \int_{-\infty}^{\infty} g(\xi)h(x-\xi)d\xi$$

**Autocorrelation**: Let g(x) be a function satisfying  $\int_{-\infty}^{\infty} |g(x)|^2 dx < \infty$  (finite energy) then

$$\Gamma_g(x) \stackrel{\triangle}{=} (g^* \star g)(x) \stackrel{\triangle}{=} \int_{-\infty}^{\infty} g(\xi)g^*(\xi - x)d\xi$$
$$= g(x) * g^*(-x)$$

**Cross correlation**: Let g(x) and h(x) be functions with finite energy. Then

$$(g^* \star h)(x) \stackrel{\triangle}{=} \int_{-\infty}^{\infty} g^*(\xi)h(\xi + x)d\xi$$
$$= \int_{-\infty}^{\infty} g^*(\xi - x)h(\xi)d\xi$$
$$= (h^* \star g)^*(-x)$$

## The Delta Function: $\delta(x)$

- Scaling:  $\delta(ax) = \frac{1}{|a|}\delta(x)$
- Sifting:  $\int_{-\infty}^{\infty} \delta(x-a) f(x) dx = f(a)$

$$\int_{-\infty}^{\infty} \delta(x) f(x+a) dx = f(a)$$

• Convolution:  $\delta(x) * f(x) = f(x)$ 

- Product:  $h(x)\delta(x) = h(0)\delta(x)$
- $\delta^2(x)$  no meaning
- $\delta(x) * \delta(x) = \delta(x)$
- Fourier Transform of  $\delta(x)$ :  $\mathcal{F}\{\delta(x)\}=1$
- Derivatives:

$$\int_{-\infty}^{\infty} \delta^{(n)}(x) f(x) dx = (-1)^n f^{(n)}(0)$$

$$- \delta'(x) * f(x) = f'(x)$$

$$x \delta(x) = 0$$

- $x\delta'(x) = -\delta(x)$
- Meaning of  $\delta[h(x)]$ :

$$\delta[h(x)] = \sum_{i} \frac{\delta(x - x_i)}{|h'(x_i)|}$$

# The Shah Function: $\mathbf{II}(x)$

- Sampling:  $\mathbb{I}(x)g(x) = \sum_{n=-\infty}^{\infty} g(n)\delta(x-n)$
- Replication:  $\mathbf{II}(x) * g(x) = \sum_{n=-\infty}^{\infty} g(x-n)$
- Fourier Transform:  $\mathcal{F}\{\mathbb{II}(x)\} = \mathbb{II}(s)$
- Scaling:  $\mathbb{I}(ax) = \sum \delta(ax n) = \frac{1}{|a|} \sum \delta(x \frac{n}{a})$

## Even and Odd Impulse Pairs

Even: 
$$II(x) = \frac{1}{2}\delta(x + \frac{1}{2}) + \frac{1}{2}\delta(x - \frac{1}{2})$$

Odd: 
$$I_{\mathbf{I}}(x) = \frac{1}{2}\delta(x + \frac{1}{2}) - \frac{1}{2}\delta(x - \frac{1}{2})$$

Fourier Transforms: 
$$\mathcal{F}\{\mathbb{I}(x)\} = \cos \pi s$$

$$\mathcal{F}\{\mathbf{I}_{\mathsf{I}}(x)\} = i\sin\pi s$$

#### Fourier Transform Theorems

- Linearity:  $\mathcal{F}\{\alpha f(x) + \beta g(x)\} = \alpha F(s) + \beta G(s)$
- Similarity:  $\mathcal{F}\{g(ax)\} = \frac{1}{|a|}G(\frac{s}{a})$
- Shift:  $\mathcal{F}\{g(x-a)\} = e^{-i2\pi as}G(s)$

$$\mathcal{F}\{g(ax-b)\} = \frac{1}{|a|}e^{-i2\pi s\frac{b}{a}}G(\frac{s}{a})$$

- Rayleigh's:  $\int_{-\infty}^{\infty} |g(x)|^2 dx = \int_{-\infty}^{\infty} |G(s)|^2 ds$
- Power:  $\int_{-\infty}^{\infty} f(x)g^*(x)dx = \int_{-\infty}^{\infty} F(s)G^*(s)ds$
- Modulation:

$$\mathcal{F}\{g(x)\cos(2\pi s_0 x)\} = \frac{1}{2}[G(s-s_0) + G(s+s_0)]$$

$$\mathcal{F}\{g^* \star g\} = |G(s)|^2$$

$$\mathcal{F}\{g^* \star f\} = G^*(s)F(s)$$

• Derivative:

$$\mathcal{F}\{g'(x)\} = i2\pi s G(s)$$

$$- \qquad \mathcal{F}\{g^{(n)}(x)\} = (i2\pi s)^n G(s)$$

$$- \qquad \mathcal{F}\{x^n q(x)\} = (\frac{i}{2\pi})^n G^{(n)}(s)$$

• Fourier Integral: If g(x) is of bounded variation and is absolutely integrable, then

$$\mathcal{F}^{-1}\{\mathcal{F}\{g(x)\}\} = \frac{1}{2}[g(x^+) + g(x^-)]$$

• Moments:

$$\int_{-\infty}^{\infty} f(x)dx = F(0)$$

$$\int_{-\infty}^{\infty} x f(x)dx = \frac{i}{2\pi} F'(0)$$

$$\int_{-\infty}^{\infty} x^n f(x)dx = (\frac{i}{2\pi})^n F^{(n)}(0)$$

• Miscellaneous:

If 
$$\mathcal{F}{g(x)} = G(s)$$
 then and

$$\mathcal{F}\{G(x)\} = g(-s)$$
$$\mathcal{F}\{g^*(x)\} = G^*(-s)$$

$$\mathcal{F}\left\{\int_{-\infty}^{x}g(\xi)d\xi\ \right\}=\tfrac{1}{2}G(0)\delta(s)+\frac{G(s)}{i2\pi s}$$

## **Function Widths**

• Equivalent Width

$$W_f \stackrel{\triangle}{=} \frac{\int_{-\infty}^{\infty} f(x)dx}{f(0)} = \frac{F(0)}{f(0)}$$
$$= \frac{F(0)}{\int_{-\infty}^{\infty} F(s)ds} = \frac{1}{W_F}$$

• Autocorrelation Width

$$W_{f^*\star f} \stackrel{\triangle}{=} \frac{\int_{-\infty}^{\infty} f^* \star f \, dx}{f^* \star f \mid_{x=0}}$$

$$= \frac{|F(0)|^2}{\int_{-\infty}^{\infty} |F(s)|^2 ds} = \frac{1}{W_{|F|^2}}$$

• Standard Deviation of Instantaneous Power:  $\Delta x$ 

$$(\Delta x)^2 \stackrel{\triangle}{=} \frac{\int_{-\infty}^{\infty} x^2 |f(x)|^2 dx}{\int_{-\infty}^{\infty} |f(x)|^2 dx} - \left[ \frac{\int_{-\infty}^{\infty} x |f(x)|^2 dx}{\int_{-\infty}^{\infty} |f(x)|^2 dx} \right]^2$$

$$(\Delta s)^2 \stackrel{\triangle}{=} \frac{\int_{-\infty}^{\infty} s^2 |F(s)|^2 ds}{\int_{-\infty}^{\infty} |F(s)|^2 ds} - \left[ \frac{\int_{-\infty}^{\infty} s |F(s)|^2 ds}{\int_{-\infty}^{\infty} |F(s)|^2 ds} \right]^2$$

- Uncertainty Relation:  $(\Delta x)(\Delta s) \ge \frac{1}{4\pi}$ 

#### Central Limit Theorem

Given a function f(x), if F(s) has a single absolute maximum at s=0; and, for sufficiently small |s|,  $F(s) \approx a-cs^2$  where  $0 < a < \infty$  and  $0 < c < \infty$ , then:

$$\lim_{n \to \infty} \frac{\left[\sqrt{n}f(\sqrt{n}x)\right]^{*n}}{a^n} = \sqrt{\frac{\pi a}{2}}e^{-\frac{\pi a}{c}x^2}$$

and

$$[f(x)]^{*n} \approx \frac{a^{n+\frac{1}{2}}}{n^{\frac{1}{2}}} \sqrt{\frac{\pi}{c}} e^{-\frac{\pi a}{cn}x^2}$$

#### Linear Systems

For a linear system w(t) = S[v(t)] with response  $h(t, \tau)$  to a unit impulse at time  $\tau$ :

$$S[\alpha v_1(t) + \beta v_2(t)] = \alpha S[v_1(t)] + \beta S[v_2(t)]$$
$$w(t) = \int_{-\infty}^{\infty} v(\tau)h(t,\tau)d\tau$$

If such a system is time-invariant, then:

$$w(t - \tau) = \mathcal{S}[v(t - \tau)]$$

and

$$w(t) = \int_{-\infty}^{\infty} v(\tau)h(t-\tau)d\tau$$
$$= (v*h)(t)$$

The eigenfunctions of any linear time-invariant system are  $e^{i2\pi f_0t}$ , since for a system with transfer function H(s), the response to an input of  $v(t) = e^{i2\pi f_0t}$  is given by:  $w(t) = H(f_0)e^{i2\pi f_0t}$ .

#### Sampling Theory

$$\begin{array}{lcl} \hat{g}(x) & = & \mathrm{I\!I\!I}(\frac{x}{X})g(x) \\ & = & X \sum_{n=-\infty}^{\infty} g(nX)\delta(x-nX) \end{array}$$

Whittaker-Shannon-Kotelnikov Theorem: For a bandlimited function g(x) with cutoff frequencies  $\pm s_c$ , and with no discrete sinusoidal components at frequency  $s_c$ ,

$$g(x) = \sum_{n=-\infty}^{\infty} g(\frac{n}{2s_c}) sinc[2s_c(x - \frac{n}{2s_c})]$$

# Fourier Tranforms for Periodic Functions

For a function p(x) with period L, let  $f(x) = p(x) \sqcap (\frac{x}{L})$ . Then

$$p(x) = f(x) * \sum_{n=-\infty}^{\infty} \delta(x - nL)$$

$$P(s) = \frac{1}{L} \sum_{n=-\infty}^{\infty} F(\frac{n}{L}) \delta(s - \frac{n}{L})$$

The complex fourier series representation:

$$p(x) = \sum_{n = -\infty}^{\infty} c_n e^{i2\pi \frac{n}{L}x}$$

where

$$c_n = \frac{1}{L}F(\frac{n}{L})$$
$$= \frac{1}{L}\int_{-L/2}^{L/2} p(x)e^{-i2\pi\frac{n}{L}x}dx$$

#### The Discrete Fourier Transform

Let g(x) be a physical process, and let f(x) = g(x) for  $0 \le x \le L$ , f(x) = 0 otherwise. Suppose f(x) is approximately bandlimited to  $\pm B$  Hz, so we sample f(x) every 1/2B seconds, obtaining N = |2BL| samples.

The Discrete Fourier Transform:

$$F_m = \sum_{n=0}^{N-1} f_n e^{-i\frac{2\pi mn}{N}}$$
 for  $m = 0, \dots, N-1$ 

The Inverse Discrete Fourier Transform:

$$f_n = \frac{1}{N} \sum_{m=0}^{N-1} F_m e^{i\frac{2\pi mn}{N}}$$
 for  $n = 0, \dots, N-1$ 

# Convolution:

$$h_n = \sum_{k=0}^{N-1} f_k g_{n-k}$$
 for  $n = 0, ..., N-1$   
where  $f, g$  are periodic

### Serial Product:

$$h_n = \sum_{k=0}^{N-1} f_k g_{n-k}$$
 for  $n = 0, \dots, 2N - 2$   
where  $f, g$  are not periodic

## DFT Theorems

• Linearity:  $\mathcal{DFT}\{\alpha f_n + \beta g_n\} = \alpha F_m + \beta G_m$ 

• Shift:  $\mathcal{DFT}\{f_{n-k}\} = F_m e^{-i\frac{2\pi}{N}km} \ (f \text{ periodic})$ 

• Parseval's:  $\sum_{n=0}^{N-1} f_n g_n^* = \frac{1}{N} \sum_{m=0}^{N-1} F_m G_m^*$ 

• Convolution:  $F_m G_m = \mathcal{DFT}\{\sum_{k=0}^{N-1} f_k g_{n-k}\}$ 

#### The Hilbert Transform

The Hilbert Transform of f(x):

$$F_{Hi}(x) \stackrel{\triangle}{=} \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{f(\xi)}{\xi - x} d\xi$$
 (CPV)

The Inverse Hilbert Transform:

$$f(x) = -\frac{1}{\pi} \int_{-\infty}^{\infty} \frac{F_{Hi}(\xi)}{\xi - x} d\xi + f_{DC} \quad (CPV)$$

• Impulse response:  $-\frac{1}{\pi x}$ 

• Transfer function:  $i \ sgn(s)$ 

• Causal functions: A causal function g(x) has Fourier Transform G(s) = R(s) + iI(s), where  $I(s) = \mathcal{H}\{R(s)\}$ .

• Analytic signals: The analytic signal representation of a real-valued function v(t) is given by:

$$z(t) \stackrel{\triangle}{=} \mathcal{F}^{-1}\{2H(s)V(s)\}\$$
  
=  $v(t) - iv_{Hi}(t)$ 

- Narrow Band Signals:  $g(t) = A(t) \cos[2\pi f_0 t + \phi(t)]$ 
  - Analytic approx:  $z(t) \approx A(t)e^{i[2\pi f_0 t + \phi(t)]}$
  - Envelope: A(t) = |z(t)|
  - Phase:  $\arg[g(t)] = 2\pi f_0 t + \phi(t)$
  - Instantaneous freq:  $f_i = f_0 + \frac{1}{2\pi} \frac{d}{dt} \phi(t)$

#### The Two-Dimensional Fourier Transform

$$F(s_x, s_y) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x, y) e^{-i2\pi(s_x x + s_y y)} dx dy$$

The Inverse Two-Dimensional Fourier Transform:

$$f(x,y) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} F(s_x, s_y) e^{i2\pi(s_x x + s_y y)} ds_x ds_y$$

The Hankel Transform (zero order):

$$F(q) = 2\pi \int_0^\infty f(r)J_0(2\pi rq)rdr$$

The Inverse Hankel Transform (zero order):

$$f(r) = 2\pi \int_0^\infty F(q) J_0(2\pi r q) q dq$$

**Projection-Slice Theorem**: The 1-D Fourier transform  $P_{\theta}(s)$  of any projection  $p_{\theta}(x')$  through g(x,y) is identical with the 2-D transform  $G(s_x, s_y)$  of g(x, y), evaluated along a slice through the origin in the 2-D frequency domain, the slice being at angle  $\theta$  to the x-axis. i.e.:

$$P_{\theta}(s) = G(s\cos\theta, s\sin\theta)$$

Reconstruction by Convolution and Backprojection:

$$g(x,y) = \int_0^{\pi} \mathcal{F}^{-1}\{|s| P_{\theta}(s)\}d\theta$$
$$= \int_0^{\pi} f_{\theta}(x\cos\theta + y\sin\theta)d\theta$$
where  $f_{\theta}(x') = (2s_c^2 \text{sinc} 2s_c x' - s_c^2 \text{sinc}^2 s_c x') * p_{\theta}(x')$ 

compiled by John Jackson
