

# *Introducing Structural Equation Modeling (SEM) to Novices Using Kevin Heslin's SF-36 Data from Opioid Users*

**Ron D. Hays, Ph.D.**

May 8, 2009, 12:01-12:59pm

UCLA GIM/HSR Research Seminar Series

# Discussed at 04/27/09 RCMAR/ EXPORT Meeting

Heslin, K. C., Stein, J., Pan, D., Magladry, C.,  
& Hays, R. D. Determinants of health-related  
quality of life among clinical trial participants  
with opioid dependence

# Methods

- Baseline data
  - 344 opioid users (113 inpatient.) in multi-center open-label 13-day detox. trial: buprenorphine-naloxone vs. clonidine
  - 12 community-based treatment programs) from NIDA Clinical Trials Network
  - 01/01-02/02 (out); 02/01-07/02 (in)
- Dependent variables
  - SF-36 v. 1; Adjective Rating Scale for Withdrawal (ARSW)
- Independent Variables
  - Body Mass Index
  - Pulse Rate
  - Respiratory Rate
  - Systolic Blood Pressure
  - Abnormal Physical Exam Findings
  - Number of Health Conditions

# Physical Health

# Mental Health

16. Fitful sleep	<input type="checkbox"/> 0	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4	<input type="checkbox"/> 5	<input type="checkbox"/> 6	<input type="checkbox"/> 7	<input type="checkbox"/> 8	<input type="checkbox"/> 9

# Sample Characteristics

Scale	Mean Score
Physical functioning	50
Role limitations—physical	45
Bodily pain	47
General health perceptions	45
Emotional well-being	38
Role limitations—emotional	39
Energy	44
Social functioning	39

Variable	Mean	Range
BMI	25	16- 46
Pulse	76	47-131
Resp. rate	17	1-31
SBP	122	94-182
Exam	1.2	0-8
Conditions	2.2	0-10

# Evaluation of Model Fit

**Hypothesized Model      Observed Covariance Matrix**

# Fit Indices

---

- Normed fit index:  $\frac{\chi_{null}^2 - \chi_{model}^2}{\chi_{null}^2}$
- Non-normed fit index:  $\frac{\frac{\chi_{null}^2}{df_{null}} - \frac{\chi_{model}^2}{df_{model}}}{\left[ \frac{\chi_{null}^2}{df_{null}} - 1 \right]}$
- Comparative fit index:  $1 - \left[ \frac{\chi_{model}^2 - df_{model}}{\chi_{null}^2 - df_{null}} \right]$

# Root Mean Square Error of Approximation (RMSEA)

- Lack of fit per degrees of freedom, controlling for sample size
  - $Q = (s - \sigma(\Theta))' W(s - \sigma(\Theta))$
  - SQR of  $(Q/df) - (1/(N - G))$
- RMSEA < 0.06 are desirable

# Appendix: Identification

- Identification
  - “Every unmeasured variable in a structural model must have its scale determined. This can always be done by fixing a path from that variable to another variable at some known value (usually 1.0). An alternative method for determining the scale of an independent unmeasured variable is to fix its variance at some known value (usually 1.0).”

# Appendix: Sample Size

- “The ratio of sample size to number of free parameters to be estimated may be able to go as low as 5:1 under normal and elliptical theory. Although there is little experience on which to base a recommendation, a ratio of at least 10:1 may be more appropriate for arbitrary distributions. These ratios needs to be larger to obtain trustworthy z-tests on the significance of parameters, and still larger to yield correct model evaluation chi-square probabilities.”
