

# *Evaluating Self-Report Data Using Psychometric Methods*

Ron D. Hays, PhD ([hays@rand.org](mailto:hays@rand.org))

February 9, 2005 (3:00-6:00pm)

HS 249F

# Four Types of Data Collection Errors

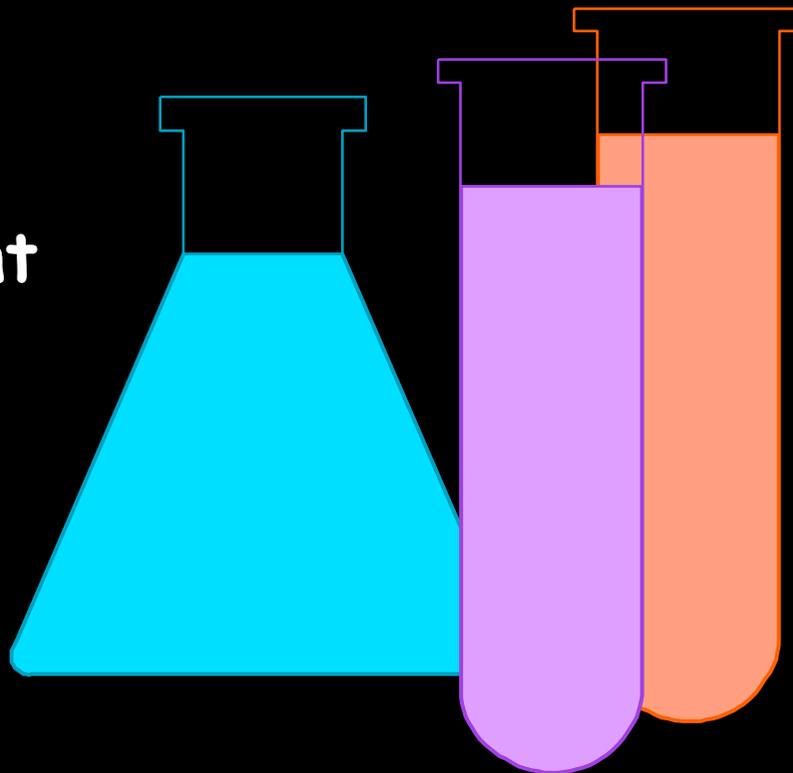

---

- Coverage Error  
Does each person in population have an equal chance of selection?
- Sampling Error  
Are only some members of the population sampled?
- Nonresponse Error  
Do people in the sample who respond differ from those who do not?
- Measurement Error  
Are inaccurate answers given to survey questions?

# What's a Good Measure?

---

- Same person gets same score (reliability)
- Different people get different scores (validity)
- People get scores you expect (validity)
- It is practical to use (feasibility)

# How Are Good Measures Developed?

---

- Review literature
- Expert input (patients and clinicians)
- Define constructs you are interested in
- Draft items (item generation)
- Pretest
  - Cognitive interviews
  - Field and pilot testing
- Revise and test again
- Translate/harmonize across languages

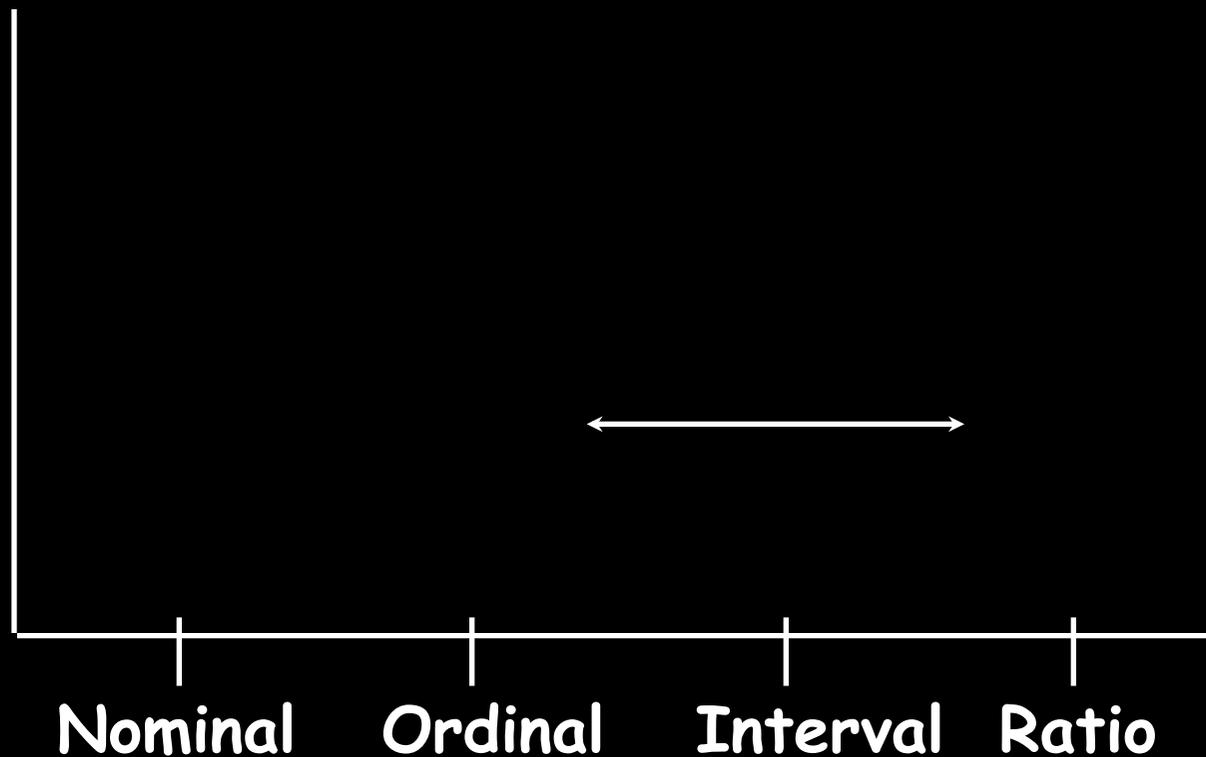

# Scales of Measurement and Their Properties

## Property of Numbers

Type of Scale	Rank Order	Equal Interval	Absolute 0
Nominal	No	No	No
Ordinal	Yes	No	No
Interval	Yes	Yes	No
Ratio	Yes	Yes	Yes

# Measurement Range for Health Outcome Measures

---

# Indicators of Acceptability

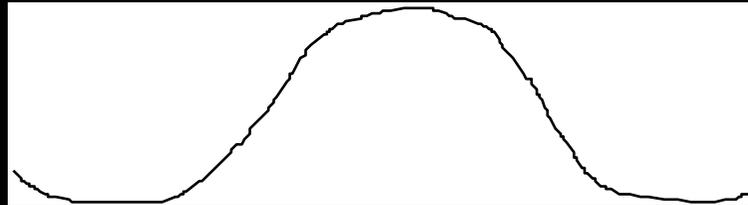

---

- Response rate
- Administration time
- Missing data (item, scale)

# Variability

---

- All scale levels are represented
- Distribution approximates bell-shaped "normal"

# Measurement Error

---

$$\text{observed} = \text{true score} + \text{systematic error} + \text{random error}$$

(bias)

# Flavors of Reliability

---

- Test-retest (administrations)
- Intra-rater (raters)
- Internal consistency (items)

# Test-retest Reliability of MMPI 317-362

$r = 0.75$

		MMPI 317		
		True	False	
MMPI 362	True	169	15	184
	False	21	95	116
		190	110	

I am more sensitive than most other people.

# Kappa Coefficient of Agreement (Corrects for Chance)

---

$$\text{kappa} = \frac{(\text{observed} - \text{chance})}{(1 - \text{chance})}$$

# Example of Computing KAPPA

		Rater A					Row Sum
		1	2	3	4	5	
Rater B	1	1	1				2
	2		2				2
	3			2			2
	4				2		2
	5					2	2
Column Sum		1	3	2	2	2	10

# Example of Computing KAPPA (Continued)

$$P_c = \frac{(1 \times 2) + (3 \times 2) + (2 \times 2) + (2 \times 2) + (2 \times 2)}{(10 \times 10)} = \boxed{0.20}$$

$$P_{\text{obs.}} = \frac{9}{10} = \boxed{0.90}$$

$$\text{Kappa} = \frac{0.90 - 0.20}{1 - 0.20} = \boxed{0.87}$$

# Guidelines for Interpreting Kappa

<u>Conclusion</u>	<u>Kappa</u>	<u>Conclusion</u>	<u>Kappa</u>
Poor	< .40	Poor	< 0.0
Fair	.40 - .59	Slight	.00 - .20
Good	.60 - .74	Fair	.21 - .40
Excellent	> .74	Moderate	.41 - .60
		Substantial	.61 - .80
		Almost perfect	.81 - 1.00

Fleiss (1981)

Landis and Koch (1977)

# Cronbach's Alpha

Source	df	SS	MS
Respondents (BMS)	4	11.6	2.9
Items (JMS)	1	0.1	0.1
Resp. x Items (EMS)	4	4.4	1.1
Total	9	16.1	

$$\text{Alpha} = \frac{2.9 - 1.1}{2.9} = \frac{1.8}{2.9} = \boxed{0.62}$$

# Alpha by Number of Items and Inter-item Correlations

---

$$\text{alpha}_{st} = \frac{K \bar{r}}{1 + (K - 1) \bar{r}}$$

$K$  = number of items in scale

# Alpha for Different Numbers of Items and Homogeneity

Average Inter-item Correlation ( $\bar{r}$ )

Number of Items (K)	Average Inter-item Correlation ( $\bar{r}$ )					
	.0	.2	.4	.6	.8	1.0
2	.000	.333	.572	.750	.889	1.000
4	.000	.500	.727	.857	.941	1.000
6	.000	.600	.800	.900	.960	1.000
8	.000	.666	.842	.924	.970	1.000

# Spearman-Brown Prophecy Formula

---

$$\alpha_y = \left( \frac{N \cdot \alpha_x}{1 + (N - 1) \cdot \alpha_x} \right)$$

$N$  = how much longer scale  $y$  is than scale  $x$

# Number of Items and Reliability for Three Versions of the Mental Health Inventory (MHI)

---

---

---

---

---

# Example Spearman-Brown Calculations

---

MHI-18

$$\frac{18/32 (0.98)}{(1+(18/32 - 1)*0.98)}$$

$$= 0.55125/0.57125 = 0.96$$

# Reliability Minimum Standards

---

- 0.70 or above (for group comparisons)
- 0.90 or higher (for individual assessment)
  - $SEM = SD (1 - reliability)^{1/2}$

# Reliability of a Composite Score

$$\text{Mosier} = 1 - \frac{\sum(w_j^2)(S_j^2) - \sum(w_j^2)(S_j^2)(\alpha_j)}{\sum(w_j^2)(S_j^2) + 2\sum(w_j)(w_k)(S_j)(S_k)(r_{jk})}$$

$w_j$  = weight given to component J

$w_k$  = weight given to component K

$S_j$  = standard deviation of J

$\alpha_j$  = reliability of J

$r_{jk}$  = correlation between J and K

# Hypothetical Multitrait/Multi-Item Correlation Matrix

---

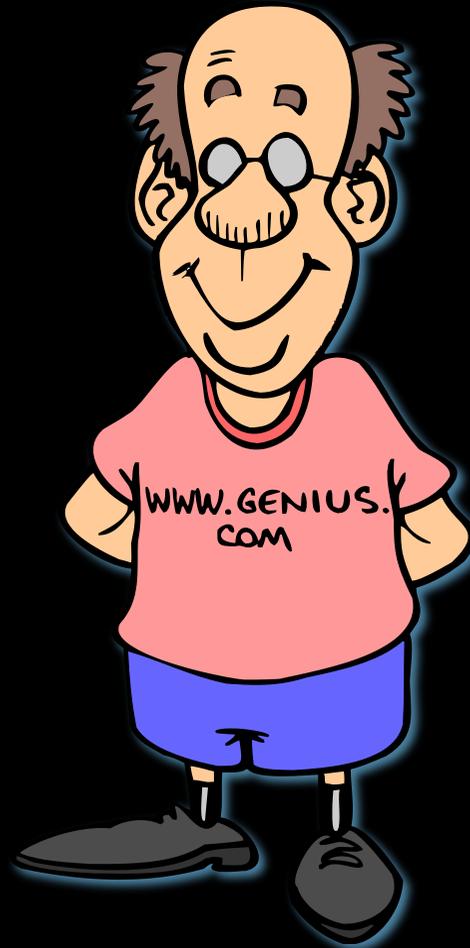

# Multitrait/Multi-Item Correlation Matrix for Patient Satisfaction Ratings

	Technical	Interpersonal	Communication	Financial
<b>Technical</b>				
1	0.66*	0.63†	0.67†	0.28
2	0.55*	0.54†	0.50†	0.25
3	0.48*	0.41	0.44†	0.26
4	0.59*	0.53	0.56†	0.26
5	0.55*	0.60†	0.56†	0.16
6	0.59*	0.58†	0.57†	0.23
<b>Interpersonal</b>				
1	0.58	0.68*	0.63†	0.24
2	0.59†	0.58*	0.61†	0.18
3	0.62†	0.65*	0.67†	0.19
4	0.53†	0.57*	0.60†	0.32
5	0.54	0.62*	0.58†	0.18
6	0.48†	0.48*	0.46†	0.24

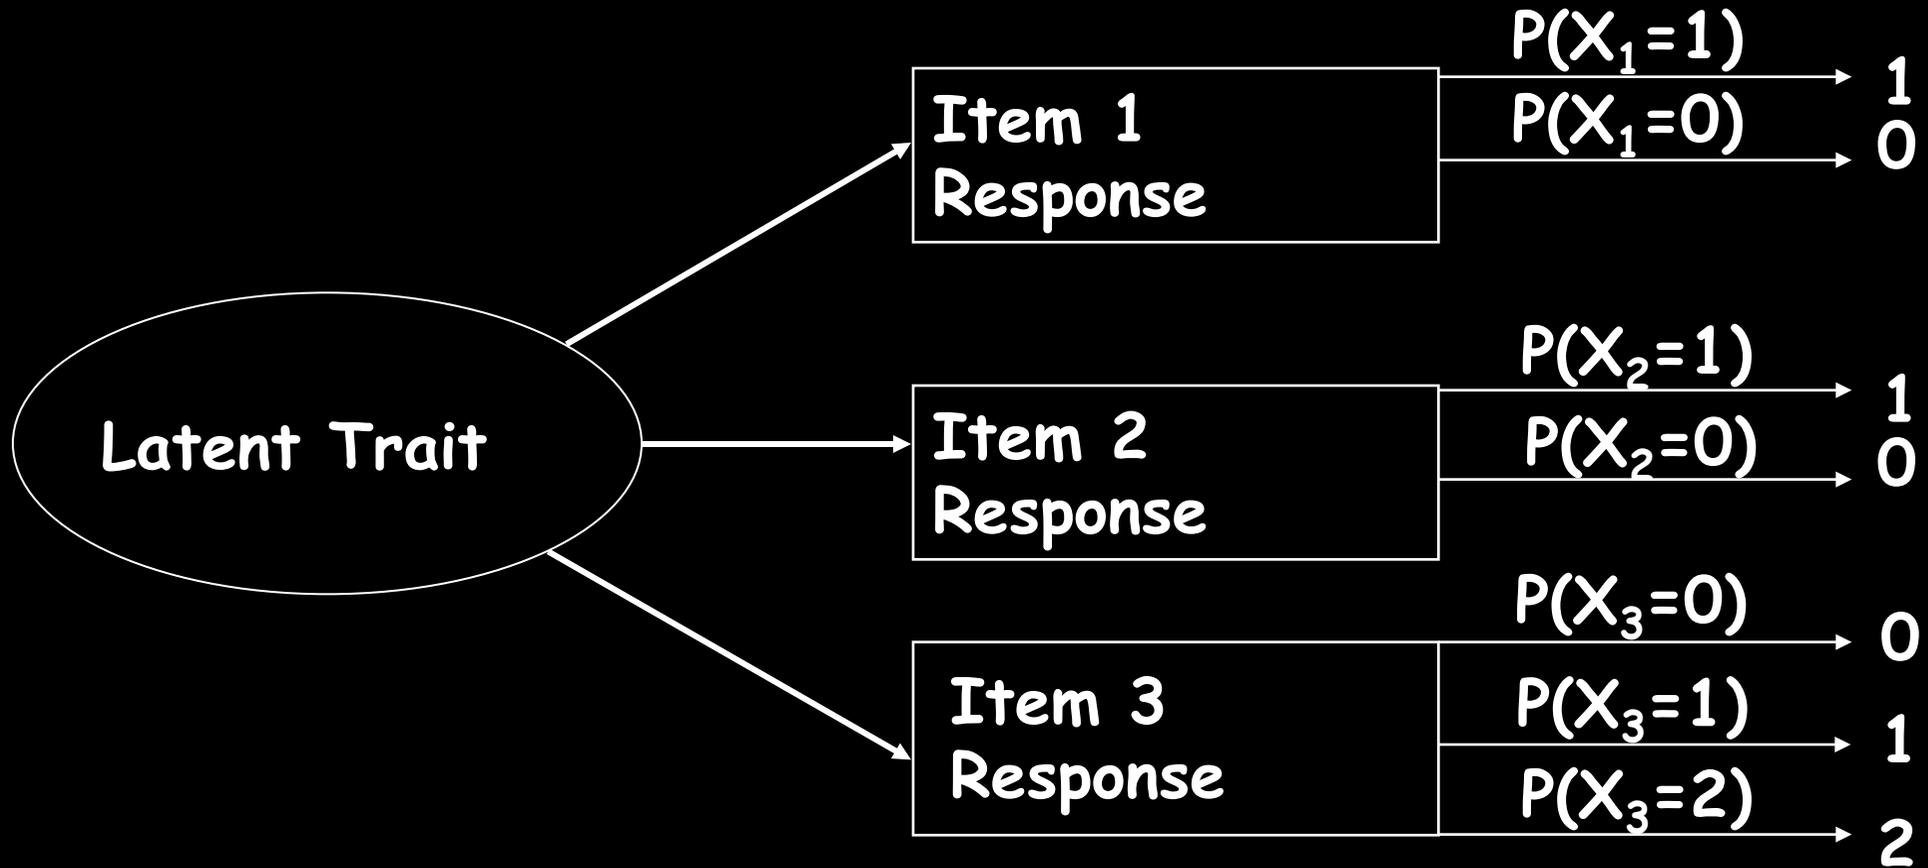

Note - Standard error of correlation is 0.03. Technical = satisfaction with technical quality. Interpersonal = satisfaction with the interpersonal aspects. Communication = satisfaction with communication. Financial = satisfaction with financial arrangements. \*Item-scale correlations for hypothesized scales (corrected for item overlap). †Correlation within two standard errors of the correlation of the item with its hypothesized scale.

# IRT

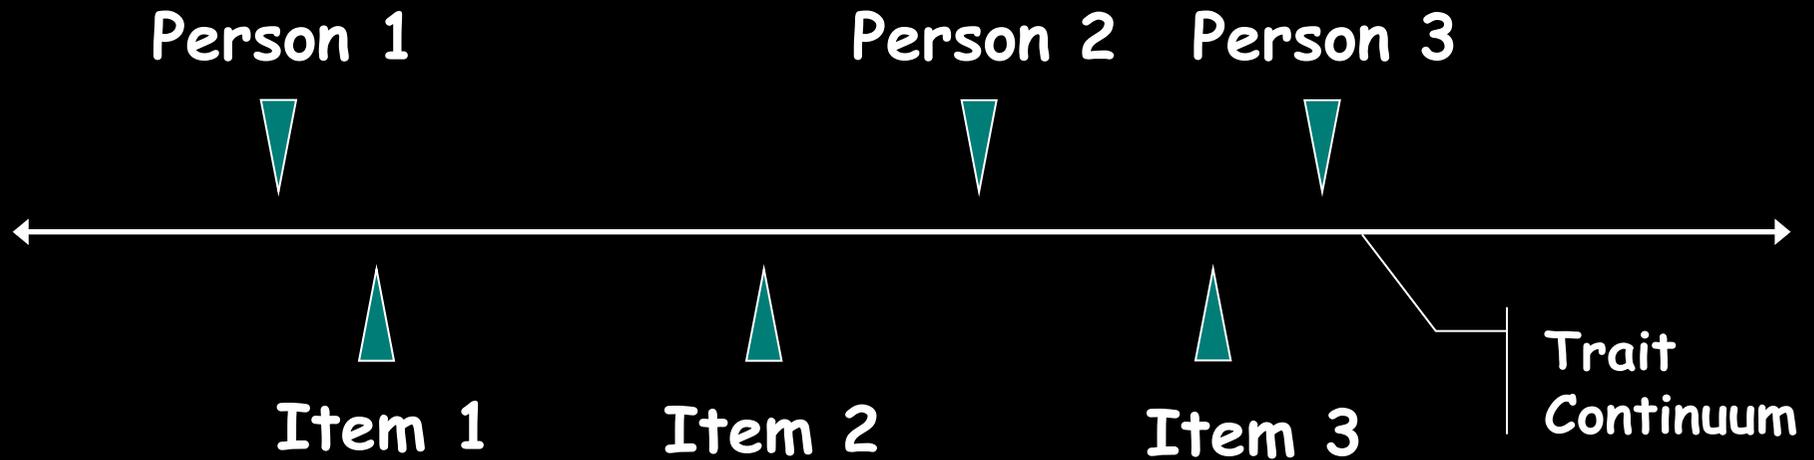

---

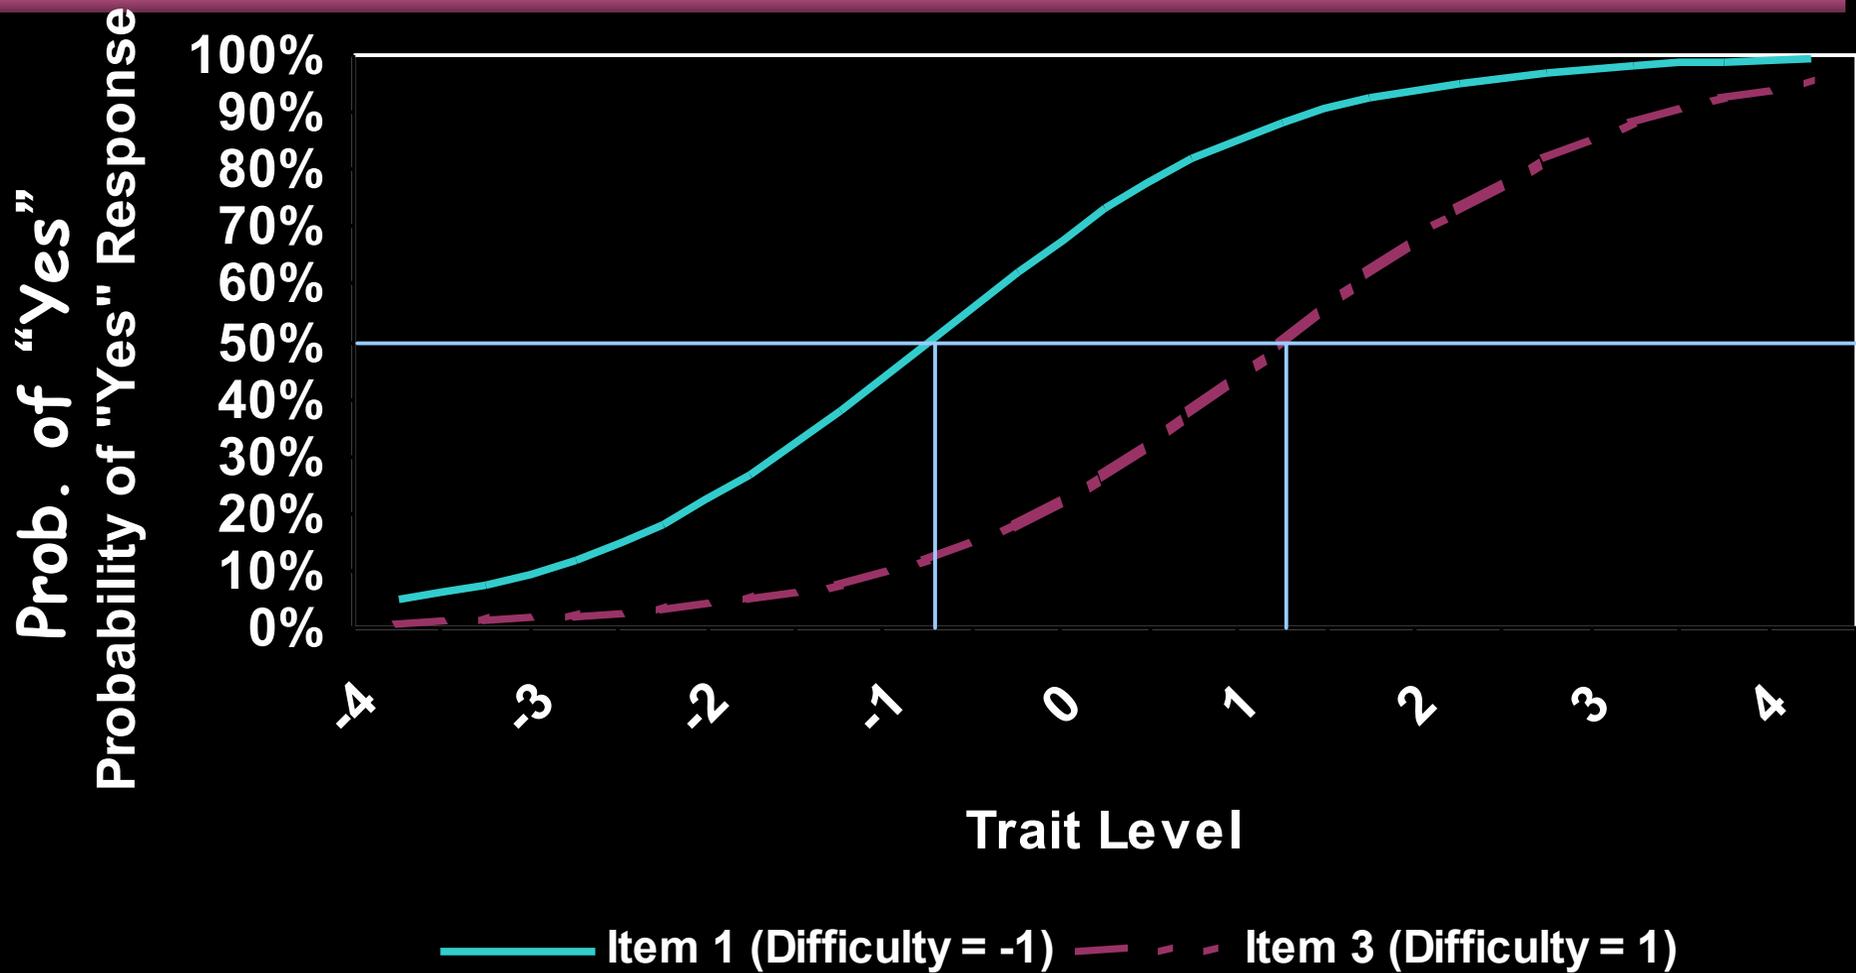

# Latent Trait and Item Responses

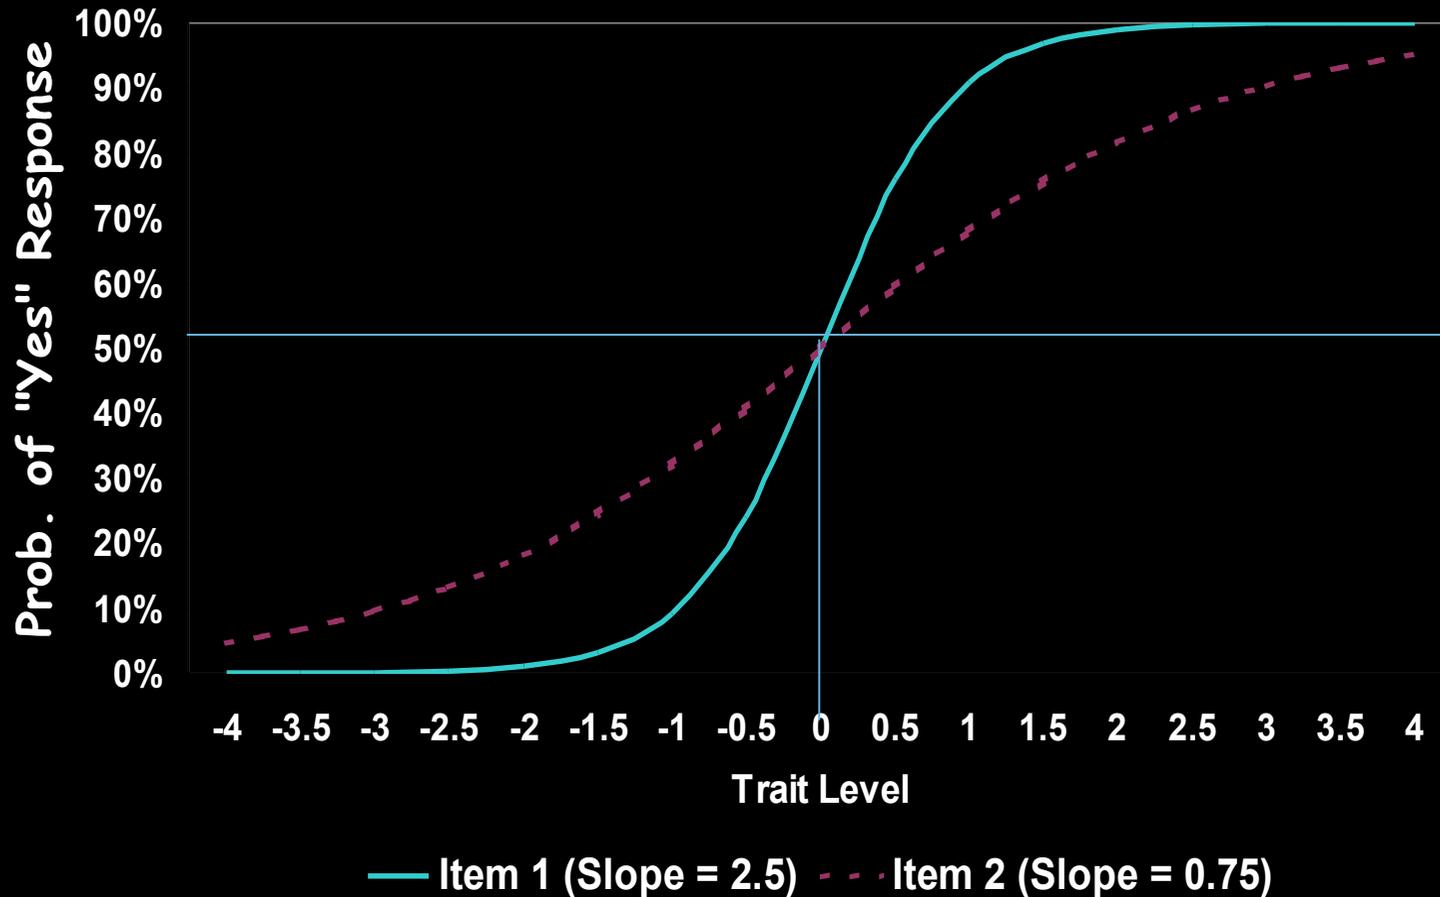

# Item Responses and Trait Levels

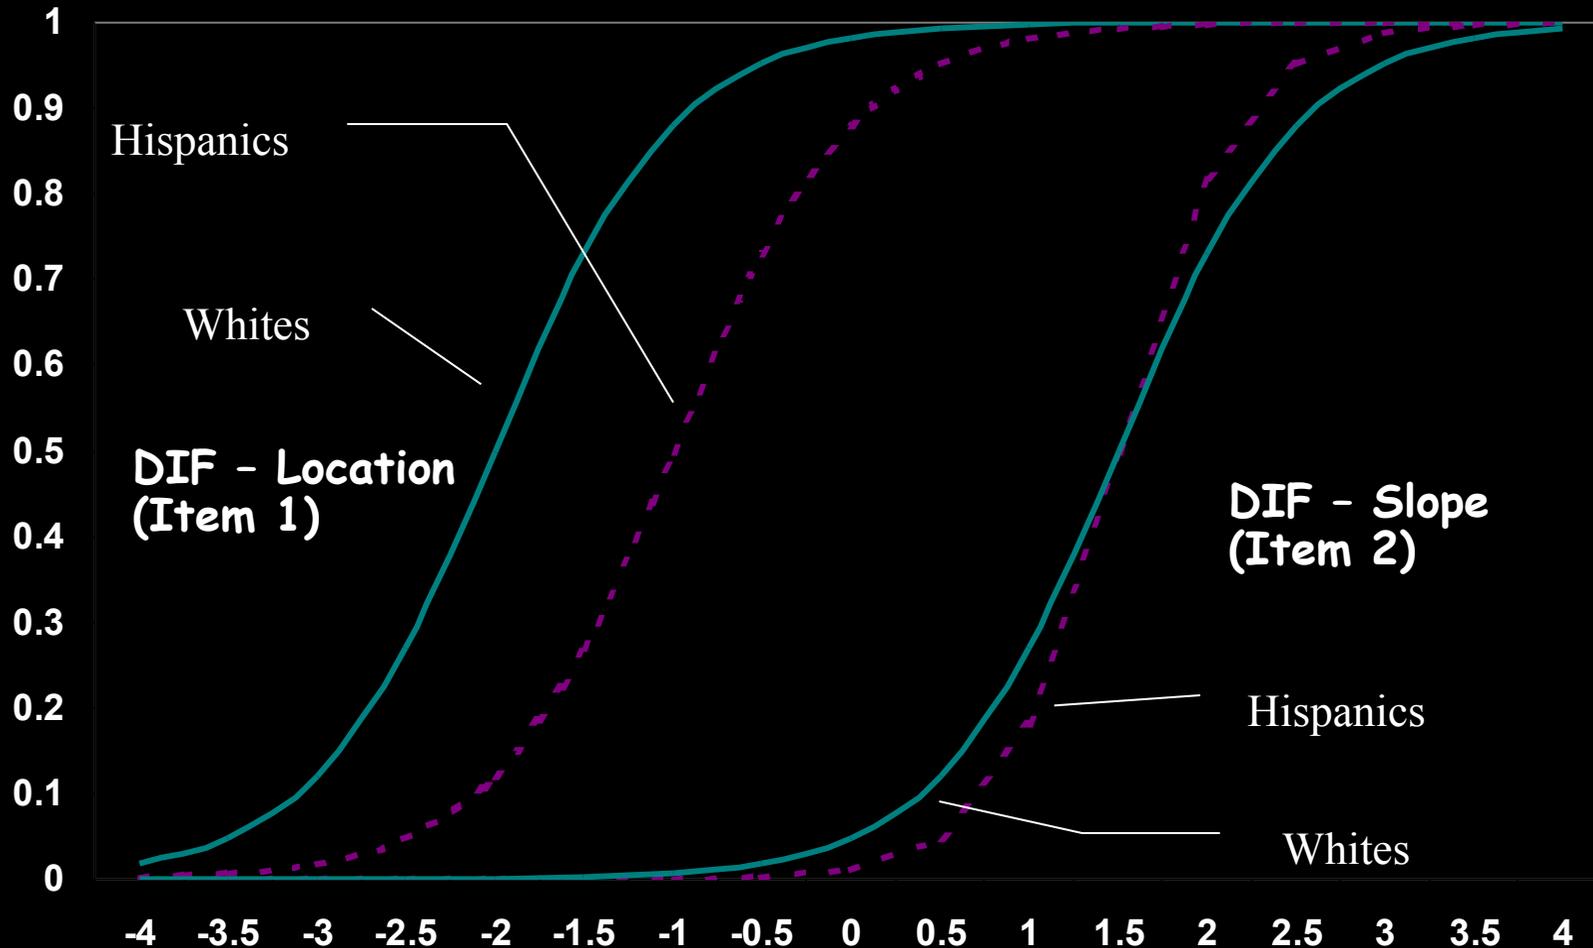

# Item Characteristic Curves (1-Parameter Model)

# Item Characteristic Curves (2-Parameter Model)

# Dichotomous Items Showing DIF (2-Parameter Model)

# Forms of Validity

---

- Content, Criterion
- Construct Validity

# Construct Validity

---

- Does measure relate to other measures in ways consistent with hypotheses?
- Responsiveness to change

# Relative Validity Analyses

---

- Form of "known groups" validity
- Relative sensitivity of measure to important clinical differences

# Relative Validity Example

## Severity of Heart Disease

	None	Mild	Severe	F-ratio	Relative Validity
Scale #1	91	90	87	2	---
Scale #2	88	78	74	10	5
Scale #3	95	87	77	20	10

# Responsiveness to Change and Minimally Important Difference

---

- HRQOL measures should be responsive to interventions that changes HRQOL
- Evaluating responsiveness requires assessment of HRQOL
  - pre-post intervention of known efficacy
  - at two times in tandem with gold standard

# Two Essential Elements

---

- External indicator of change (Anchors)
  - mean change in HRQOL scores among people who have a “minimal” change in HRQOL.
- Amount of HRQOL change

# External Indicator of Change (A)

---

- Overall has there been any change in your asthma since the beginning of the study?

*Much improved; Moderately improved; Minimally improved*

**No change**

*Much worse; Moderately worse; Minimally worse*

# External Indicator of Change (B)

---

Rate your overall condition. This rating should encompass factors such as social activities, performance at work or school, seizures, alertness, and functional capacity; that is, your overall quality of life.

7 response categories; ranging from no impairment to extremely severe impairment

# External Indicator of Change (C)

---

- “changed” group = seizure free (100% reduction in seizure frequency)
- “unchanged” group = <50% change in seizure frequency

# Responsiveness Indices

(1) Effect size (ES) =  $D/SD$

(2) Standardized Response Mean (SRM) =  $D/SD^{\dagger}$

(3) Guyatt responsiveness statistic (RS) =  $D/SD^{\ddagger}$

D = raw score change in “changed” group;

SD = baseline SD;

$SD^{\dagger}$  = SD of D;

$SD^{\ddagger}$  = SD of D among “unchanged”

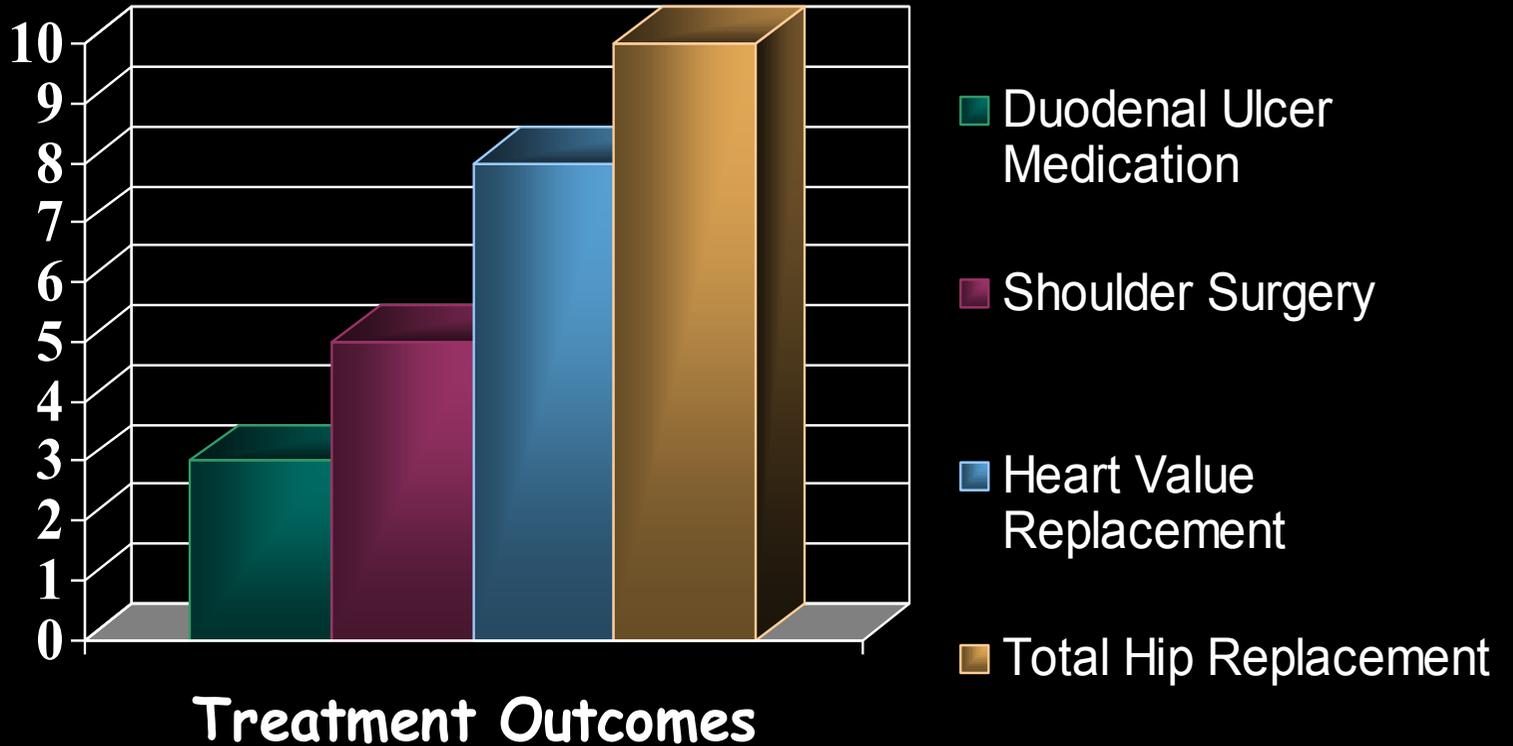

# Effect Size Benchmarks

- Small: 0.20- $\rightarrow$ 0.49
- Moderate: 0.50- $\rightarrow$ 0.79
- Large: 0.80 or above

# Treatment Impact on PCS

Impact on  
SF-36 PCS

# Treatment Impact on MCS

Impact on  
SF-36 MCS

# Individual Change

- Interest in knowing how many patients benefit from group intervention
- Tracking progress on individual patients

# Methods

---

- 54 patients
- Average age = 56; 84% white; 58% female
- Self-administered SF-36 version 2 at baseline and about at end of therapy (about 6 weeks later).

# SF-36 Version 2

---

- Physical functioning (10 items)
- Role limitations/physical (4 items)
- Pain (2 items)
- General health perceptions (5 items)
- Social functioning (2 items)
- Energy/fatigue (4 items)
- Role limitations/emotional (3 items)
- Emotional well-being (5 items)

# Scoring the SF-36

---

- Average or sum all items in the same scale.
- Transform average or sum to
  - 0 (worse) to 100 (best) possible range
  - z-score (mean = 0, SD = 1)
  - T-score (mean = 50, SD = 10)
    - ✓  $T\text{-score} = 50 + (z\text{-score} * 10)$

# t-test for within group change

---

- $X_D / (SD_d / n^{1/2})$

$X_D$  = is mean difference,  $SD_d$  = standard deviation of difference

# Formulas for Significance of Individual Change

<b>Standard error of measurement (SEM)</b>	$SD_b * (1 - \text{reliability})^{1/2}$
<b>Standard error of prediction (SEp)</b>	$SD_b * (1 - \text{reliability}^2)^{1/2}$
<b>SEM CI around Time 1 score</b>	<b>Time 1 +/- 2 SEM</b>
<b>SEp CI around Time 1 score</b>	<b>Time 1 +/- 2 SEp</b>

**RAND**<sub>HEALTH</sub>  $SD_b$  = standard deviation at baseline

# Estimated True Score for Score of 60

---

- Mean + reliability (score - mean)
- $50 + 0.90 (60 - 50) = \underline{59}$

# Reliable Change Index

---

- $(X_2 - X_1) / (SEM * \text{SQRT}[2])$

# Formulas for Significance of Individual Change

<b>SEM 95% CI</b>	$1.96 * SD_b * (1 - \text{reliability})^{1/2}$
<b>SEp 90% CI</b>	$1.64 * SD_b * (1 - \text{reliability}^2)^{1/2}$
<b>SEp 95% CI</b>	$1.96 * SD_b * (1 - \text{reliability}^2)^{1/2}$
<b>Estimated true score</b>	$\text{Mean} + \text{reliability} (\text{score} - \text{mean})$
<b>Reliable change index</b>	$X_2 - X_1 /$

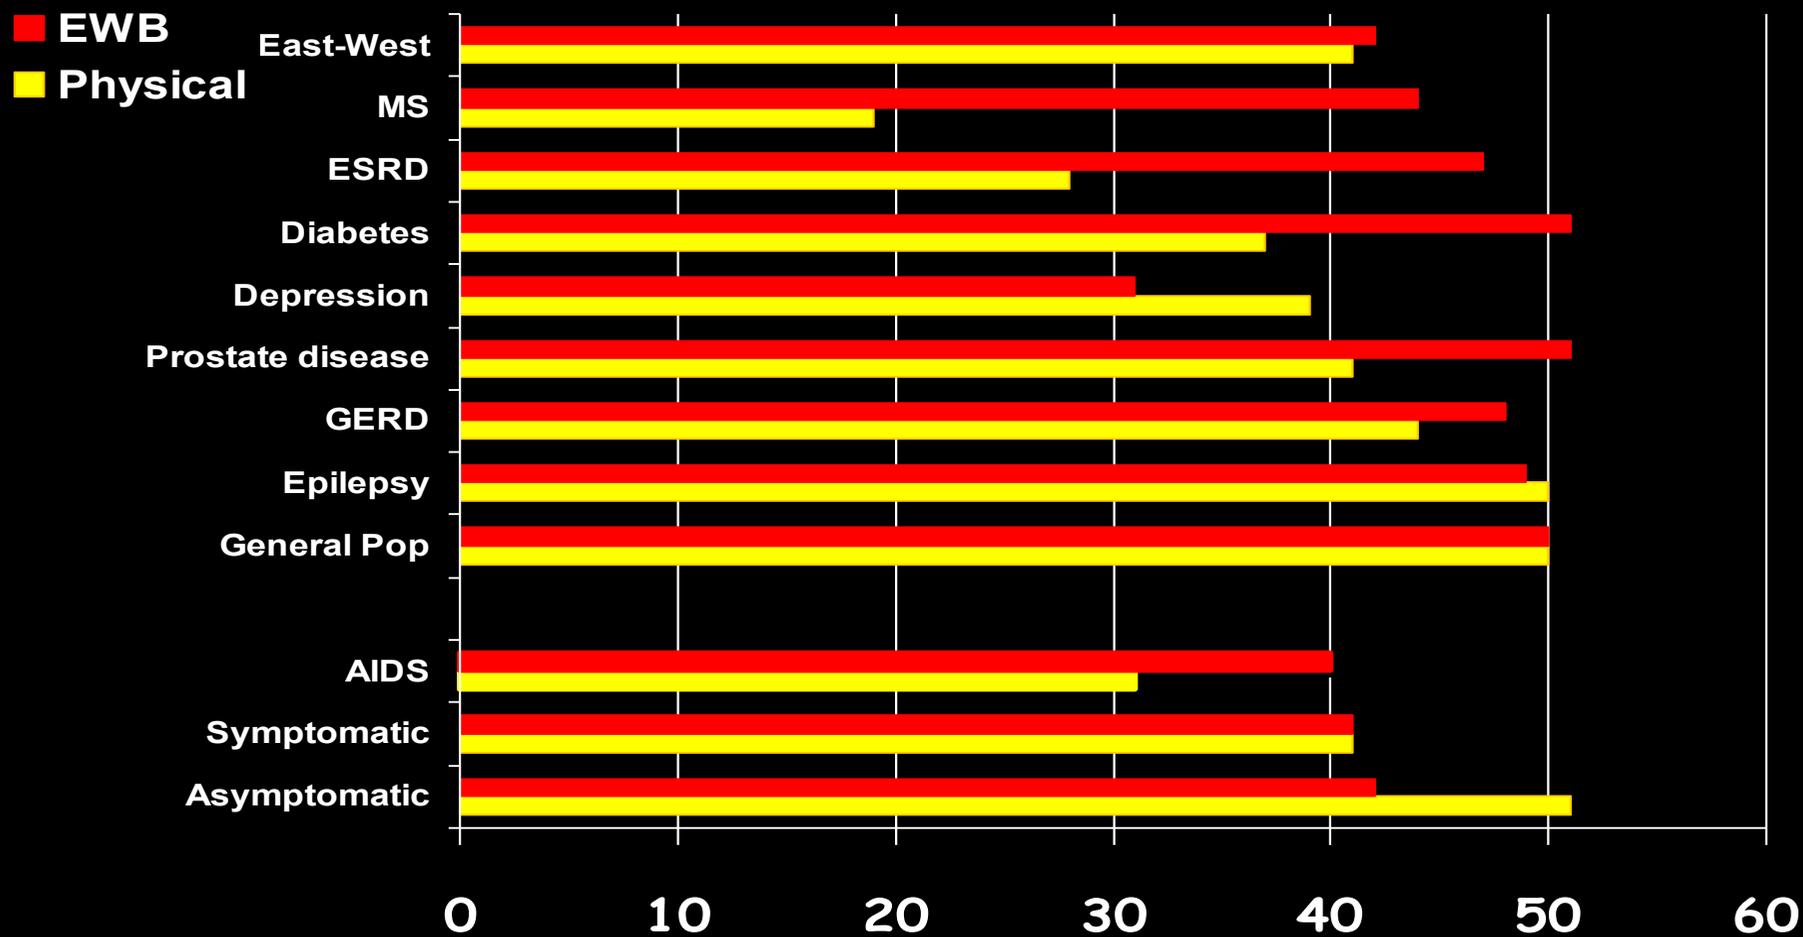

**SD<sub>b</sub>** = standard deviation at baseline

# Minimum Delta for Individual Significance

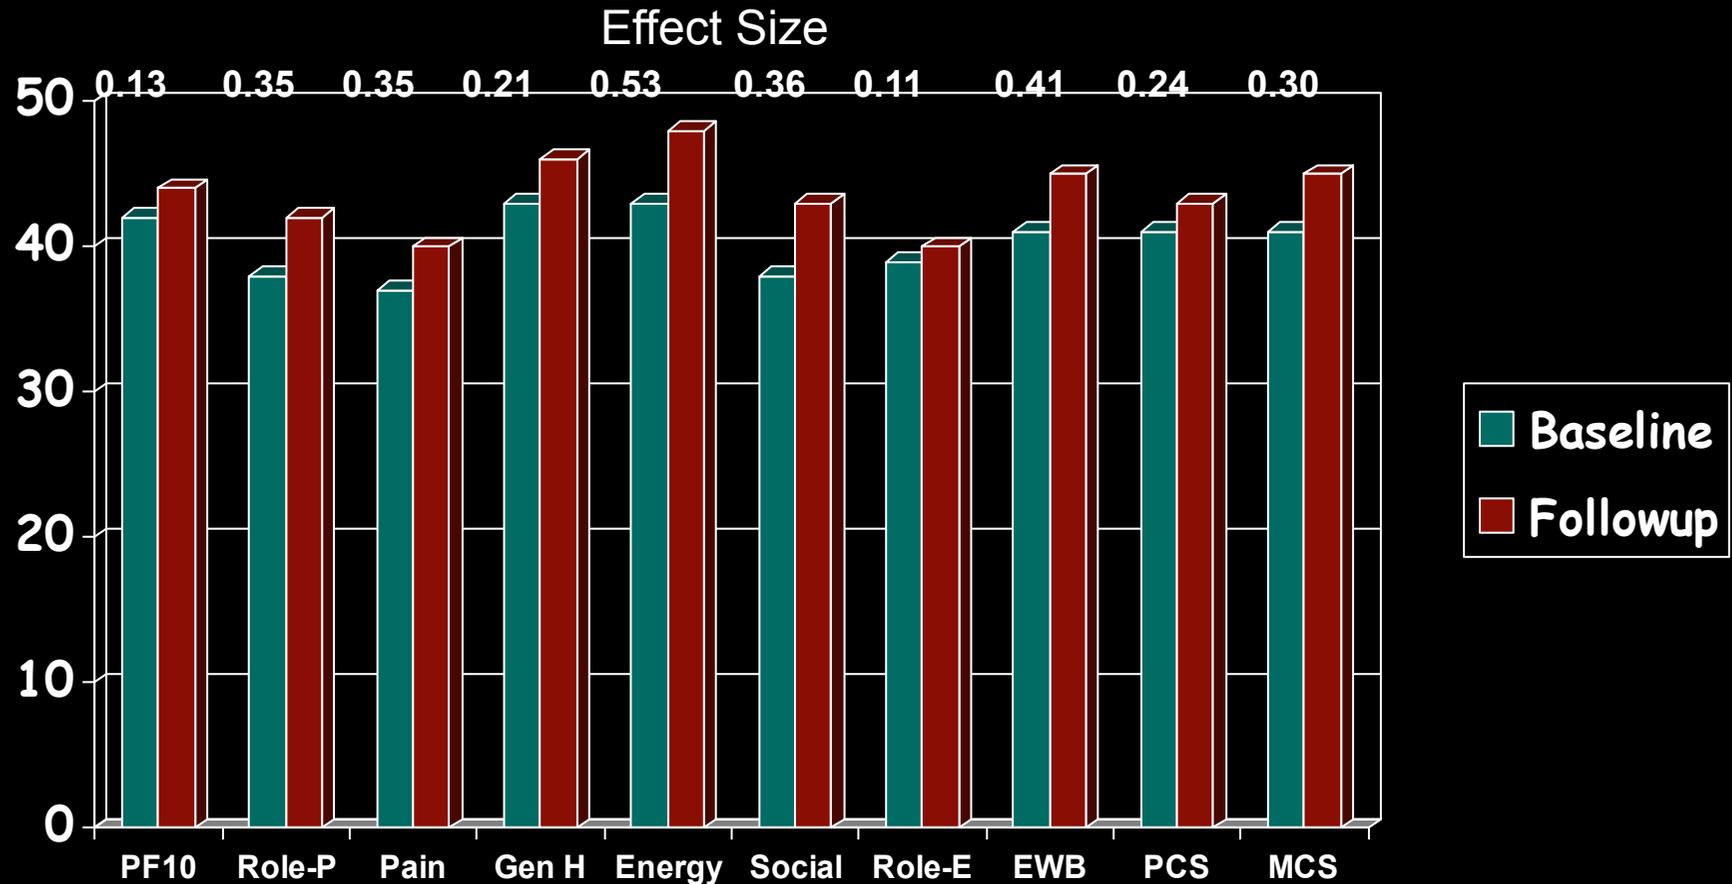

---

- SEM:  $> 1.96 \text{ SEM}$
- RCI:  $> 1.96 * \text{SQRT}(2) * \text{SEM}$
- SEp-90:  $> 1.64 \text{ SEp}$ ; SEp-95:  $> 1.96 \text{ SEp}$

# Physical Functioning and Emotional Well-Being at Baseline for 54 Patients at UCLA-Center for East West Medicine

# Change in SF-36 Scores Over Time

# Significance of Group Change

	Delta	t-test	prob.
