Class Business

- Office hours
 - Holden: Fri 10-11 am
 - Shu-Fu (TA for HW1): Mon 2-4 pm
 - Timo (TA for HW2): Wed 1-3 pm
- Homework 1 is due on 4/28 (Friday)

Outline

- Review of RF pulses
- Adiabatic passage principle
- Adiabatic inversion
- Applications of adiabatic pulses
- MATLAB demo

Review of RF Pulses

RF Pulses

- What do RF pulses do?
- Challenges at higher B_0 fields?

Notation and Conventions

$$\vec{B} = B_0 \hat{k} + B_1(t) [\cos \omega t \hat{i} - \sin \omega t \hat{j}]$$

- ω = carrier frequency
- ω_0 = resonant frequency
- $B_1(t)$ = complex valued envelope function

RF Pulse - Excitation

$$\vec{B} = B_0 \hat{k} + B_1(t) [\cos \omega t \hat{i} - \sin \omega t \hat{j}]$$

$$B_1(t) \cdot [\cos(\omega t) \hat{i} - \sin(\omega t) \hat{j}]$$

Lab vs. Rotating Frame

- The rotating frame simplifies the mathematics and permits more intuitive understanding.

Rotating Frame

Rotating Frame Definitions

$$\vec{M}_{rot} \equiv \begin{bmatrix} M_{x'} \\ M_{y'} \\ M_{z'} \end{bmatrix} \quad \vec{B}_{rot} \equiv \begin{bmatrix} B_{x'} \\ B_{y'} \\ B_{z'} \end{bmatrix} \quad \begin{aligned} B_{z'} &\equiv B_z \\ M_{z'} &\equiv M_z \end{aligned}$$

$$\vec{M}_{lab}(t) = R_Z(\omega_0 t) \cdot \vec{M}_{rot}(t)$$

$$\vec{B}_{lab}(t) = R_Z(\omega_0 t) \cdot \vec{B}_{rot}(t)$$

$$\frac{d\vec{M}}{dt} = \vec{M} \times \gamma \vec{B} \quad \longrightarrow \quad \frac{d\vec{M}_{rot}}{dt} = \vec{M}_{rot} \times \gamma \vec{B}_{eff}$$

Bloch Equation (Rotating Frame)

$$\frac{d\vec{M}_{rot}}{dt} = \vec{M}_{rot} \times \gamma \vec{B}_{eff}$$

where $\vec{B}_{eff} = \vec{B}_{rot} + \frac{\vec{\omega}_{rot}}{\gamma}$ fictitious field

$$\vec{\omega}_{rot} = \begin{pmatrix} 0 \\ 0 \\ -\omega \end{pmatrix}$$

Bloch Equation (Rotating Frame)

$$\vec{B}_{eff} = \vec{B}_{rot} + \frac{\vec{\omega}_{rot}}{\gamma}$$

$$\vec{B}_{lab} = \begin{pmatrix} B_1(t) \cos \omega_0 t \\ B_1(t) \sin \omega_0 t \\ B_0 \end{pmatrix} \quad \vec{B}_{rot} = \begin{pmatrix} B_1(t) \\ B_1(t) \\ B_0 \end{pmatrix}$$

Assume real-valued $B_1(t)$

$$\vec{B}_{rot} = \begin{pmatrix} B_1(t) \\ 0 \\ B_0 \end{pmatrix} \quad \vec{B}_{eff} = \begin{pmatrix} B_1(t) \\ 0 \\ B_0 - \frac{\omega}{\gamma} \end{pmatrix}$$

To the board ...

Bloch Equation with Gradient

$$\frac{d\vec{M}_{rot}}{dt} = \vec{M}_{rot} \times \gamma \vec{B}_{eff}$$

$$\vec{B}_{eff} = \begin{pmatrix} B_1(t) \\ 0 \\ B_0 - \frac{\omega}{\gamma} \end{pmatrix} \rightarrow \vec{B}_{eff} = \begin{pmatrix} B_1(t) \\ 0 \\ B_0 - \frac{\omega}{\gamma} + G_z z \end{pmatrix}$$

Bloch Equation (at on-resonance)

$$\frac{d\vec{M}_{rot}}{dt} = \vec{M}_{rot} \times \gamma \vec{B}_{eff}$$

where $\vec{B}_{eff} = \begin{pmatrix} B_1(t) \\ 0 \\ \cancel{B_0} \frac{\omega}{\gamma} + G_z z \end{pmatrix}$

$$\frac{d\vec{M}}{dt} = \begin{pmatrix} 0 & \omega(z) & 0 \\ -\omega(z) & 0 & \omega_1(t) \\ 0 & -\omega_1(t) & 0 \end{pmatrix} \vec{M}$$

$$\omega(z) = \gamma G_z z \quad \omega_1(t) = \gamma B_1(t)$$

To the board ...

B₁ Variations

- In MRI, the B₁ field is not always uniform across the imaging volume
- B₁ inhomogeneity can cause:
 - Image shading
 - Incomplete saturation (e.g. in fat suppression)
 - Incomplete inversion (e.g. CSF suppression, myocardium suppression in cardiac scar imaging)
 - Inaccurate/imprecise quantification in T₁ mapping

B₁ Variations

- It is highly desirable if we can excite tissue homogeneously and produce a uniform flip angle throughout

→ Adiabatic Pulses!

“Adiabatic pulses are a special class of RF pulses that can excite, refocus or invert magnetization vectors uniformly, even in the presence of a spatially nonuniform B₁ field.”

Adiabatic Passage Principle

Adiabatic Pulses

- A special class of RF pulses that can achieve uniform flip angle
- Flip angle is independent of the applied B_1 field

$$\theta \neq \int_0^T B_1(\tau) d\tau$$

- Slice profile of an adiabatic pulse is obtained using Bloch simulations
- Can be used for excitation, inversion and refocusing

Adiabatic vs. Non-Adiabatic Pulses

Adiabatic Pulses:

$$\theta \neq \int_0^T B_1(\tau) d\tau$$

- Amplitude and frequency/phase modulation
- Long duration (8-12 ms)
- Higher B_1 amplitude ($>12 \mu\text{T}$)
- Generally NOT multi-purpose (inversion pulse cannot be used for refocusing, etc.)

Non-Adiabatic Pulses:

$$\theta = \int_0^T B_1(\tau) d\tau$$

- Amplitude modulation, constant carrier frequency (constant phase)
- Short duration (0.3 ms to 1 ms)
- Lower B_1 amplitude
- Generally multi-purpose

Adiabatic Pulses

- Frequency modulated pulses:

$$B_1(t) = A(t) \exp^{-i \int \omega_1(t') dt'}$$

envelope

frequency
sweep

- Or phase modulation:

$$B_1(t) = A(t) \exp^{-i\phi(t)}$$

Bloch Equation (at on-resonance)

$$B_1(t) = A(t) \exp^{-i \int \omega_1(t') dt'}$$

$$\frac{d\vec{M}}{dt} = \vec{M} \times \gamma \vec{B}_{eff}$$

where $\vec{B}_{eff} = \begin{pmatrix} A(t) \\ 0 \\ \cancel{B_0} + \frac{\omega_1(t)}{\gamma} \end{pmatrix}$

$$\frac{d\vec{M}}{dt} = \begin{pmatrix} 0 & \omega_1(t) & 0 \\ -\omega_1(t) & 0 & \gamma A(t) \\ 0 & -\gamma A(t) & 0 \end{pmatrix} \vec{M}$$

Magnetization Plot

To the board ...

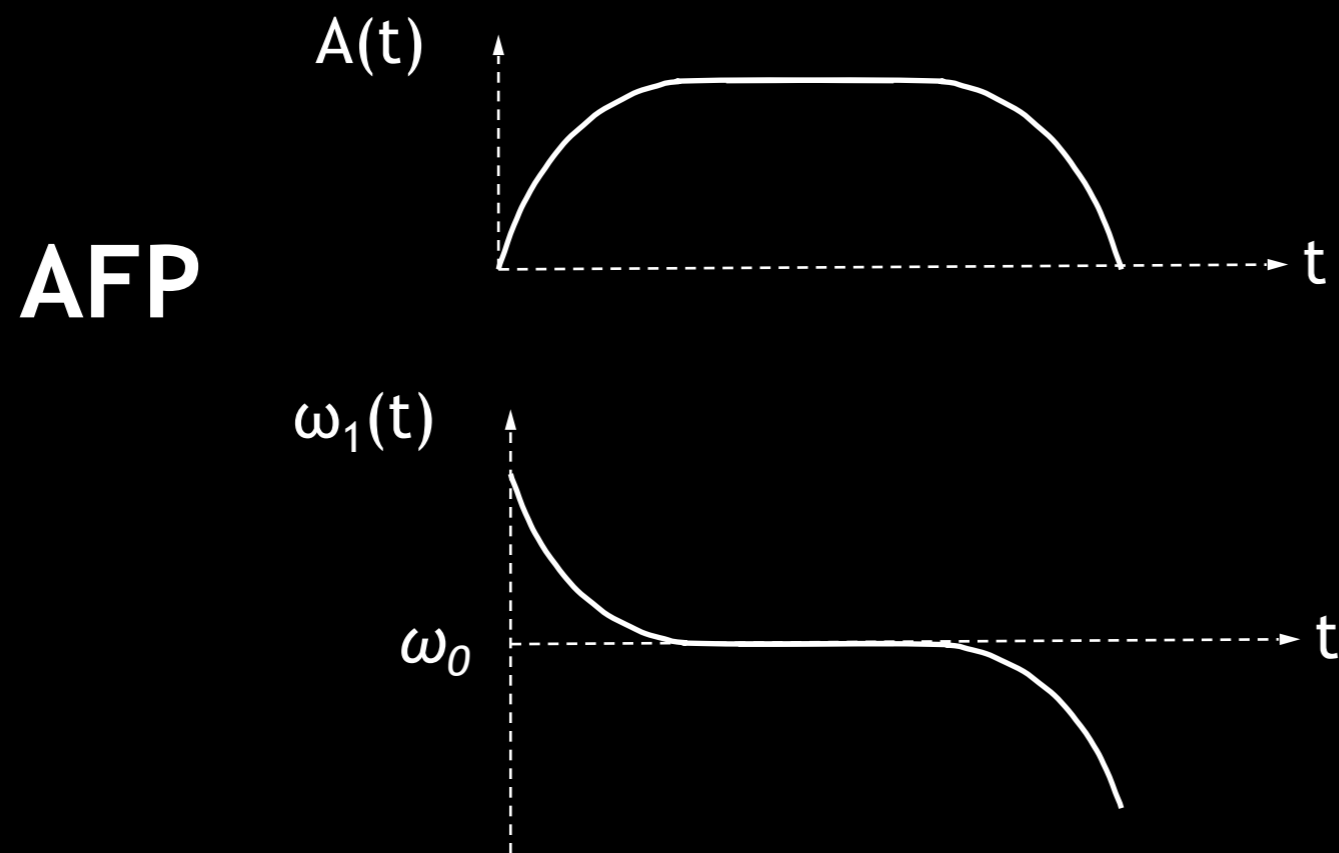

Adiabatic Excitation

- At the end of the pulse, all the magnetization is in the transverse plane \rightarrow so we have adiabatic excitation!
- This is also called an **adiabatic half passage (AHP)**

Adiabatic Inversion

- An adiabatic inversion requires an adiabatic full passage (AFP) pulse:

Adiabatic Inversion

Adiabatic Inversion

Design of Adiabatic Inversion

- General equation for an adiabatic pulse:

$$B_1(t) = A(t) \exp^{-i \int \omega_1(t') dt'}$$

- Many different types of adiabatic pulses can be designed by choosing different amplitude and frequency modulation functions
- The most famous one is...

The Hyperbolic Secant Inversion Pulse!

Hyperbolic Secant Pulse Equations

$$B_1(t) = A(t) \exp^{-i \int \omega_1(t') dt'}$$

where

$$A(t) = A_0 \operatorname{sech}(\beta t)$$

$$\omega_1(t) = -\mu \beta \tanh(\beta t)$$

A_0 : peak amplitude (μT)

β : frequency modulation parameter (rad/s)

μ : phase modulation parameter (dimensionless)

Hyperbolic Secant Pulse Example

Amplitude Modulation, $A(t)$

Frequency Modulation, $\omega_1(t)$

Pulse Parameters:

$$A_0 = 12 \mu T$$

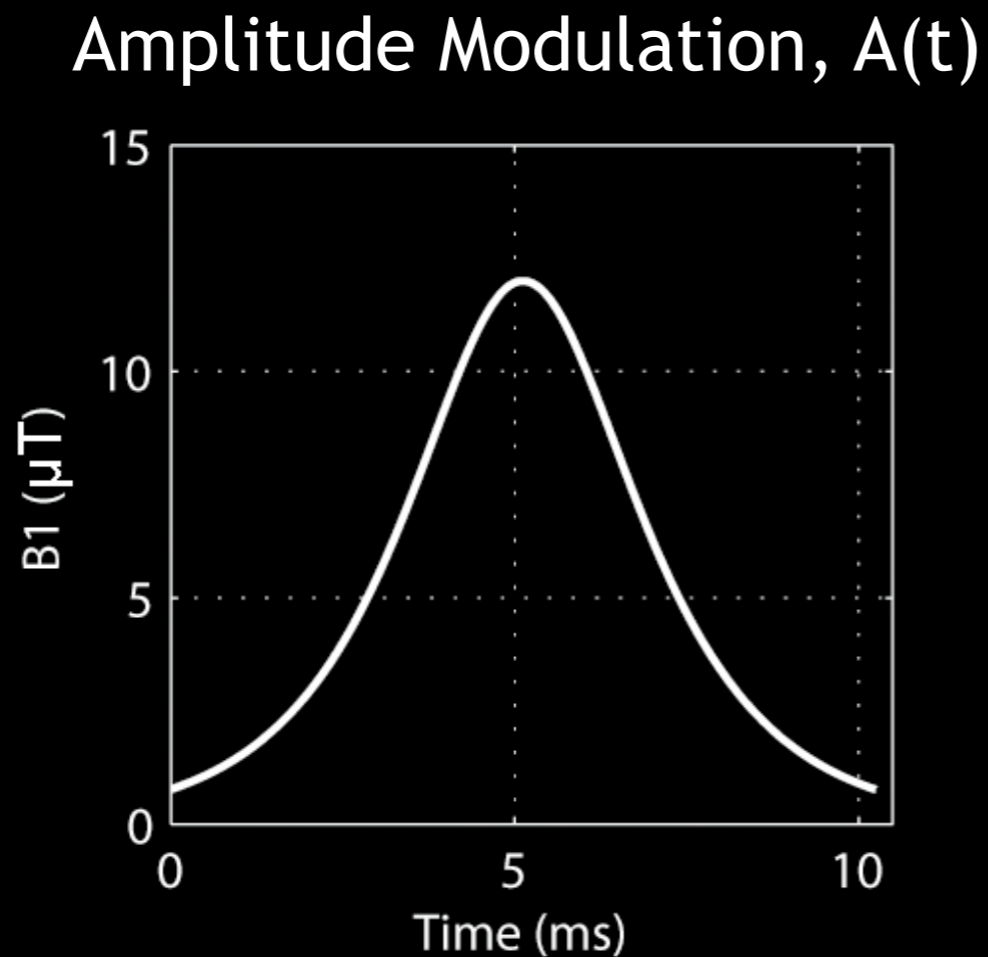

$$\mu = 5$$

$$\beta = 672 \text{ rad/s}$$

$$\text{Duration} = 10.24 \text{ ms}$$

Comparing Hyperbolic Secant with an AFP Example

Hyperbolic Secant Pulse

General Adiabatic Full Passage pulse

Some Examples of Other Adiabatic Inversion Pulses

Pulse Name	A(t)	$\omega_1(t)$
Lorentz	$\frac{1}{1+\beta\tau^2}$	$\frac{\tau}{1+\beta\tau^2} + \frac{1}{\sqrt{\beta}} \tan^{-1}(\sqrt{\beta}\tau)$
HS	$\text{sech}(\beta\tau)$	$\frac{\tanh(\beta\tau)}{\tanh(\beta)}$
Gauss ^c	$\exp\left(-\frac{\beta^2\tau^2}{2}\right)$	$\frac{\text{erf}(\beta\tau)}{\text{erf}(\beta)}$
Hanning	$\frac{1+\cos(\pi\tau)}{2}$	$\tau + \frac{4}{3\pi} \sin(\pi\tau) \left[1 + \frac{1}{4} \cos(\pi\tau) \right]$
HSn ^c (n=8)	$\text{sech}(\beta\tau^n)$	$\int \text{sech}^2(\beta\tau^n) d\tau$
Sin40 ^d (n=40)	$1 - \left \sin^n\left(\frac{\pi\tau}{2}\right) \right $	$\tau - \int \sin^n\left(\frac{\pi\tau}{2}\right) \left(1 + \cos^2\left(\frac{\pi\tau}{2}\right) \right) d\tau$

Some Examples of Other Adiabatic Inversion Pulses

Pulse Name	A(t)	$\omega_1(t)$
Lorentz	$\frac{1}{1+\beta\tau^2}$	$\frac{\tau}{1+\beta\tau^2} + \frac{1}{\sqrt{\beta}} \tan^{-1}(\sqrt{\beta}\tau)$
HS	$\text{sech}(\beta\tau)$	$\frac{\tanh(\beta\tau)}{\tanh(\beta)}$

The shape of the inversion profile depends on the choice A(t) and $\omega_1(t)$!

HSn^c (n=8) $\text{sech}(\beta\tau^n)$ $\int \text{sech}^2(\beta\tau^n) d\tau$

Sin40^d (n=40) $1 - \left| \sin^n\left(\frac{\pi\tau}{2}\right) \right|$ $\tau - \int \sin^n\left(\frac{\pi\tau}{2}\right) \left(1 + \cos^2\left(\frac{\pi\tau}{2}\right)\right) d\tau$

What Will Inversion Profile Look Like?

Hyperbolic Secant
Pulse

Amplitude Modulation, $A(t)$

Frequency Modulation, $\omega_1(t)$

Inversion Profile

Inversion Profiles

- The inversion profile typically calculated using Bloch simulation of the RF pulse (will be covered later) shows us the inversion efficiency and RF bandwidth
- The inversion efficiency depends strongly on the B_1 amplitude (as well as pulse duration, T_1 , T_2 and pulse shape)
- For the hyperbolic secant pulse,

$$\text{RF spectral bandwidth} = \mu\beta$$

$$B_{1\text{max}} \gg (\beta\sqrt{\mu})/\gamma \quad (B_1 \text{ threshold for adiabaticity})$$

Hyperbolic Secant: Adiabatic Property

Original Pulse (100%)

$$B_{1\max} = 12 \mu\text{T}$$

75% Attenuated Pulse

$$B_{1\max} = 9 \mu\text{T}$$

Hyperbolic Secant: Adiabatic Property

Original Pulse (100%)

$$B_{1\max} = 12 \mu\text{T}$$

60% Attenuated Pulse

$$B_{1\max} = 7.2 \mu\text{T}$$

B_1 Threshold $\approx 6 \mu\text{T}$

Original Pulse (100%)

$$B_1 = 12 \mu\text{T}$$

125% Amplified Pulse

$$B_1 = 15 \mu\text{T}$$

150% Amplified Pulse

$$B_1 = 18 \mu\text{T}$$

Comments

- Many envelope/modulation functions work
- If a range of adiabaticity is required, optimization can help reduce pulse length
- Hyperbolic secant needs to be truncated, which can affect the overall performance

Applications of Adiabatic Pulses

Adiabatic Pulses

- Fat suppression (STIR)
- CSF suppression (FLAIR)
- Myocardium suppression in cardiac scar imaging (LGE)
- Black blood cardiac imaging (DIR TSE)
- T_1 Mapping

Late Gadolinium Enhancement (LGE)

- Gold standard for detection of scar/myocardial fibrosis
- Spoiled gradient echo (SPGR) sequence with an inversion pulse (inversion recovery SPGR)
 - Inversion pulse is usually hyperbolic secant pulse
 - Healthy myocardium is nulled with the inversion pulse
 - Scar tissue (which has shorter T_1 than healthy tissue) appear bright

- The conventional LGE sequence uses an RF-spoiled gradient echo (FLASH) readout with an inversion recovery (IR) pulse as a preparation pulse
- The readout is acquired at a time after inversion at which the healthy myocardium signal reaches zero

Inversion recovery curves of postcontrast scar (white) and myocardium (red)

Hyper-enhanced scar region

Nulled signal from healthy myocardium

Clinical Example

Patient with healthy myocardium

Patient with scar tissue

Clinical Example

Late Gadolinium Enhancement (LGE) in patients with implantable cardiac devices

- Presence of an implantable cardiac device in the patients produces an interesting off-resonance artifact

**Hyper-
intensity
Artifacts**

Hyper-intensity artifact

**Conventional IR
LGE Image**

**Conventional IR
LGE Image**

Cause of Artifact

Longitudinal magnetization produced
by conventional IR pulse
BW = 1.1 kHz

Solution: Increase Bandwidth of Inversion Pulse

Longitudinal magnetization produced by
conventional IR pulse
BW = 1.1 kHz

Longitudinal magnetization produced
by wideband IR pulse
BW = 3.8 kHz

No artifact (no ICD)

Conventional IR
LGE Image

Hyper-intensity artifact

Conventional IR
LGE Image

Hyper-intensity artifact corrected

Wideband IR
LGE Image

Hyper-intensity artifacts

Antero-lateral scar
difficult to diagnose

**Artifacts
eliminated**

Antero-lateral
scar clearly
visible

MATLAB Demo

```

%%% User inputs:
mu = 5;      % Phase modulation parameter [dimensionless]
beta1 = 672; % Frequency modulation parameter [rad/s]
pulseWidth = 10.24; % RF pulse duration [ms]
A0 = 0.12;   % Peak B1 amplitude [Gauss].

%%%%%%%%

nSamples = 512; % number of samples in the RF pulse
dt = pulseWidth/nSamples/1000; % time step, [seconds]
tim_sech = linspace(-pulseWidth/2,pulseWidth/2,nSamples)./1000';
% time scale to calculate the RF waveforms in seconds.

% Amplitude modulation function B1(t):
B1 = A0.* sech(beta1.*tim_sech);

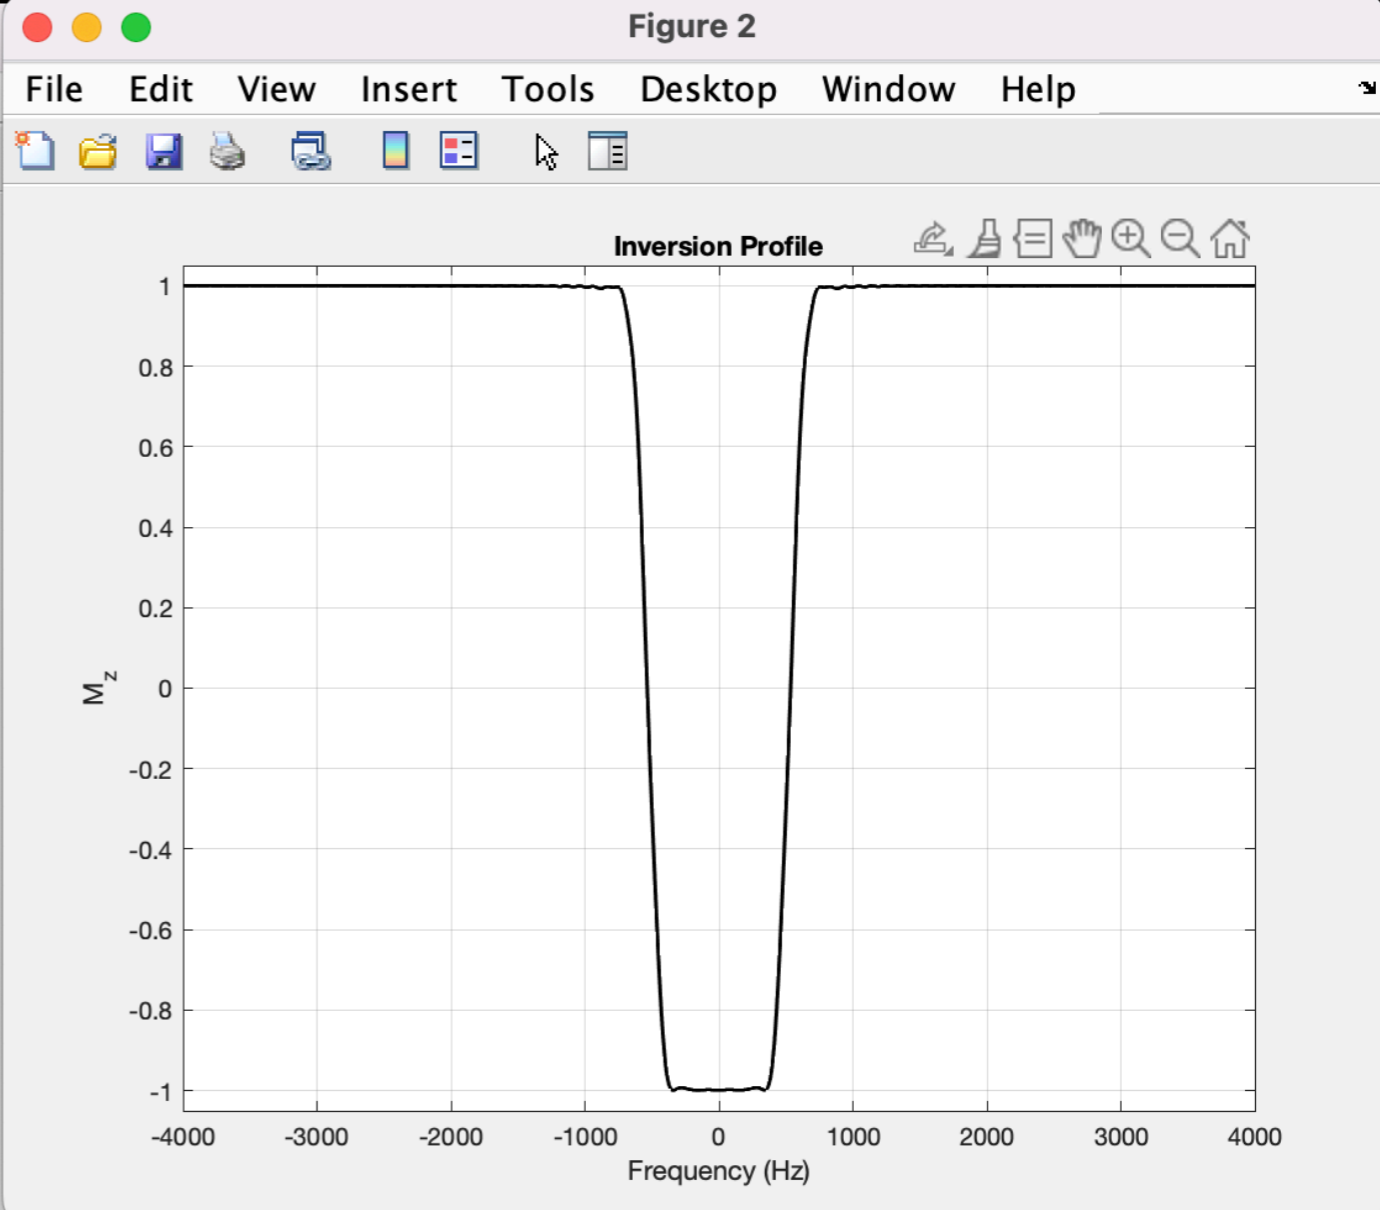

% Carrier frequency modulation function w(t):
w = -mu.*beta1.*tanh(beta1.*tim_sech)./(2*pi);
% The 2*PI scaling factor at the end converts the unit from rad/s to Hz

% Phase modulation function phi(t):
phi = mu .* log(sech(beta1.*tim_sech));

% Put together complex RF pulse waveform:
rf_pulse = B1 .* exp(1i.*phi);

% Generate a time scale for the Bloch simulation:
tim_bloch = [0:(nSamples-1)]*dt;

```
